

PRIMERGY rack systems Design guide

Issue March 25, 2008

Product Rack Systems

Pages 89

Introduction and highlights

Rack systems are based on the EIA-310-D 19-inch standard, according to which rack cabinets, servers and other components, such as UPSs, hubs, routers, modems and operating consoles, are manufactured. The term "standard" suggests a specification and definition of all prevalent dimensions and construction requirements relating to the mechanics and electrical equipment of these rack systems. In fact, only a few dimensions and weights are truly specified in this quasi-standard: various specifications can be interpreted too broadly, there is also a lack of tolerances in some cases, and many a dimension is not even included in the 19-inch "standard".

The problems and incompatibilities in the installation dimensions of competitor products and components from third-party vendors have always been taken into account in PRIMERGY rack systems. The PRIMECENTER rack family at the latest provides a universal and variable rack system which can accommodate most of the 19-inch components on the market without problems. Unfortunately, there will always be cases where the inaccuracy of the 19-inch standard causes problems, in particular when products from different manufacturers are to be combined.

This document is designed to facilitate the integration of PRIMERGY systems in third-party racks and the installation of third-party systems into racks from Fujitsu Siemens Computers by showing the installation requirements and the dimensions.

1 Terms and conditions

1.1 Liability and warranty

In principle, specific responsibilities must be observed in integrating components to create an overall system. They include compliance with country-specific and international regulations and provisions, such as electrical and electromagnetic behavior, safety regulations and operating conditions. The party integrating components from different vendors therefore bears responsibility, and is consequently liable for and warrants the integration work that has been carried out.

1.2 Installation rules

A broad range of servers means a large variety of combinations in the rack and the requirement that every server be operated within its thermal limits. To avoid every possible configuration having to be assessed separately, rules for installing servers and components in the racks have been established:

1. Every server is independent in its height unit(s) and respects the independence of neighboring servers.
2. Every server must be able to function with the resources of its height unit(s) (cooling, cable management, maintenance space, etc.).

These two rules restrict the creativity of developers of servers and rack-mounted systems to the height unit(s) required by the server, yet permit different solutions to coexist.

A thermal assessment of a server in the rack must take into account the following PRIMERGY servers cooling concept:

1.3 Thermal qualification

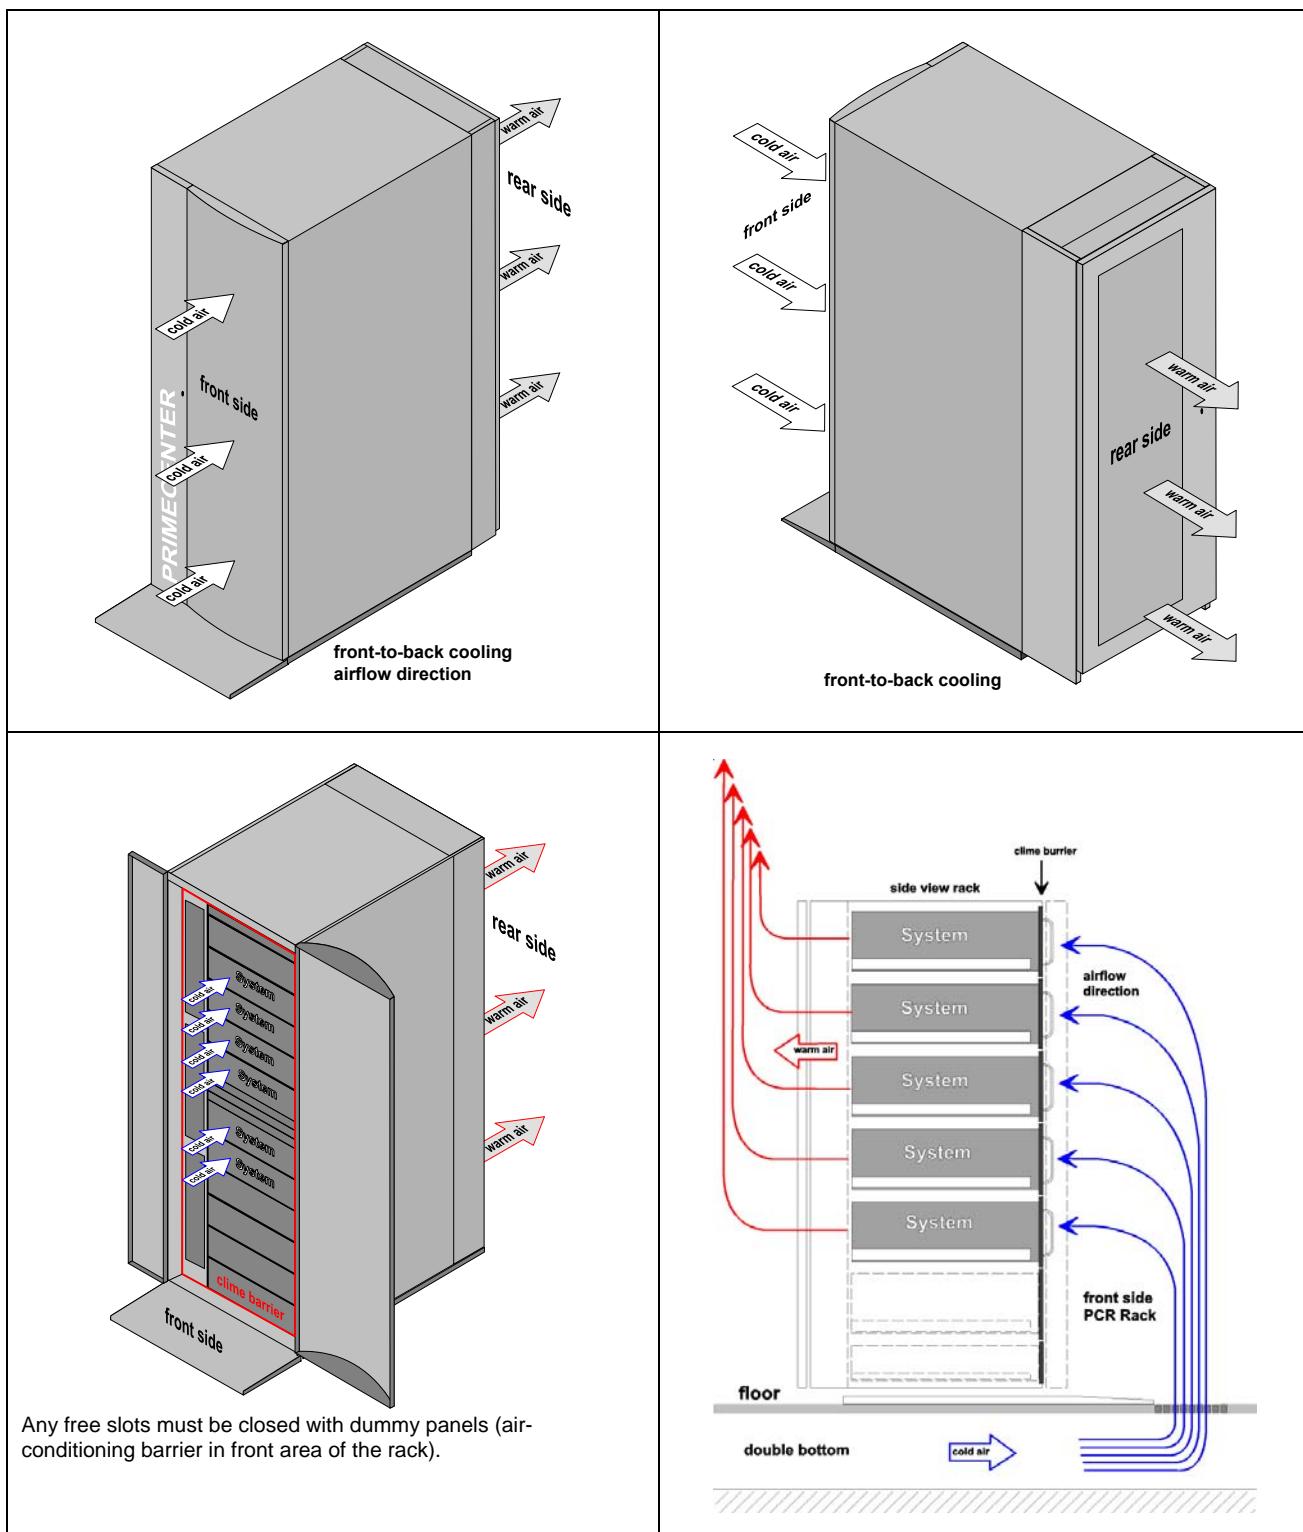

The following thermal conditions must be taken into account:

- A PRIMERGY server is cooled by an air current that is generated by fans within the server. Any emission of thermal energy is regarded as negligible and consequently does not contribute to cooling the server. In the same way, any possible supply of energy from thermal radiation is regarded as negligible and is ruled out.
- The front 19" plane is defined as a climatic boundary between the intake air and exhaust air of the rack or the server.

Therefore the following applies:

1. Following mounting of the server in a rack, the intake air area is defined as being the boundaries of the height units it occupies.
2. The floor and cover surfaces of the server are defined as adiabatic surfaces, i.e. thermal energy is not exchanged via the floor or ground surface. This prevents any influence from servers mounted above or below.

In cabling the server, the rack infrastructure is used optimally and the exhaust air area of the server is kept free to the maximum possible extent.

1.4 Analyzed configurations

As already indicated in the introduction, two cases are described in this document:

1. PRIMERGY servers or storage subsystems are to be integrated in racks from other manufacturers, possibly in coexistence with servers or storage systems from different vendors.
2. Servers, subsystems or infrastructure components (UPSs, switches, hubs) from third-party vendors are to be mounted in PRIMECENTER and PRIMERGY DataCenter racks.

These two cases must be viewed separately, namely with respect to:

- Installation dimensions of the systems, including cabling spaces and conditions relating to serviceability
- Cabling conditions and requirements
- Availability of mounting accessories and safety of mounting

This can result in a wide range of installation requirements. However, not all cases can be analyzed individually; the market in the 19-inch segment is simply too large. We are consequently focusing on products from Fujitsu Siemens Computers and the associated rack systems.

All PRIMERGY systems are developed on the basis of the same design principles. As a consequence, this analysis of the installation of PRIMERGY components is reduced to the essentials.

1.5 General suitability for installation

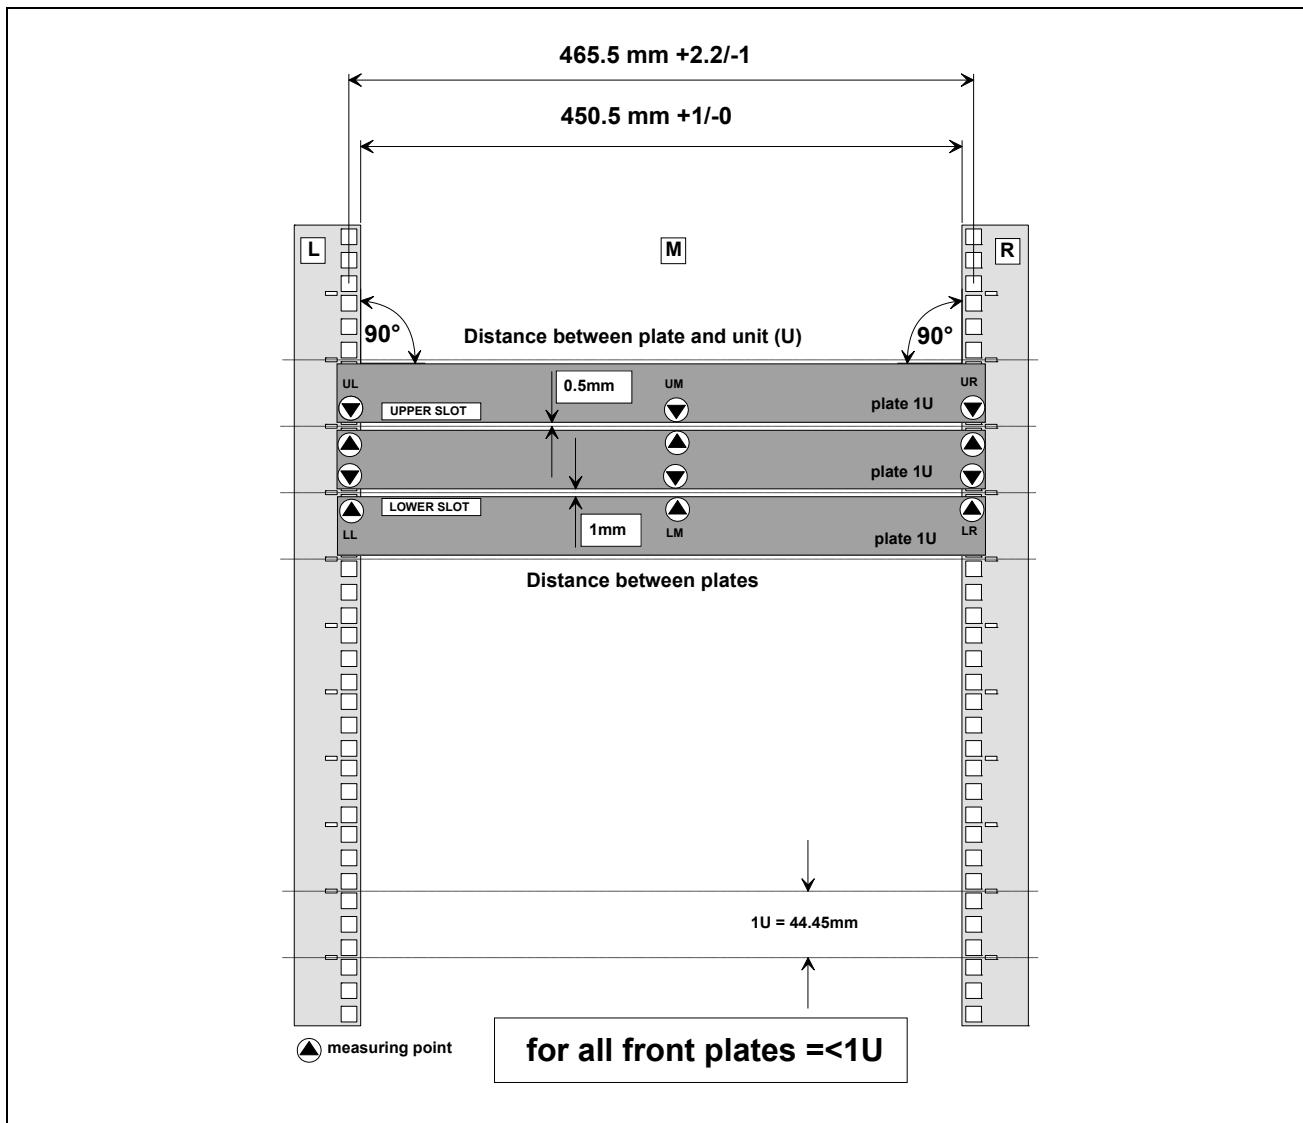

Installation of third-party products in PRIMERGY racks (EIA-310-D 19-inch standard)

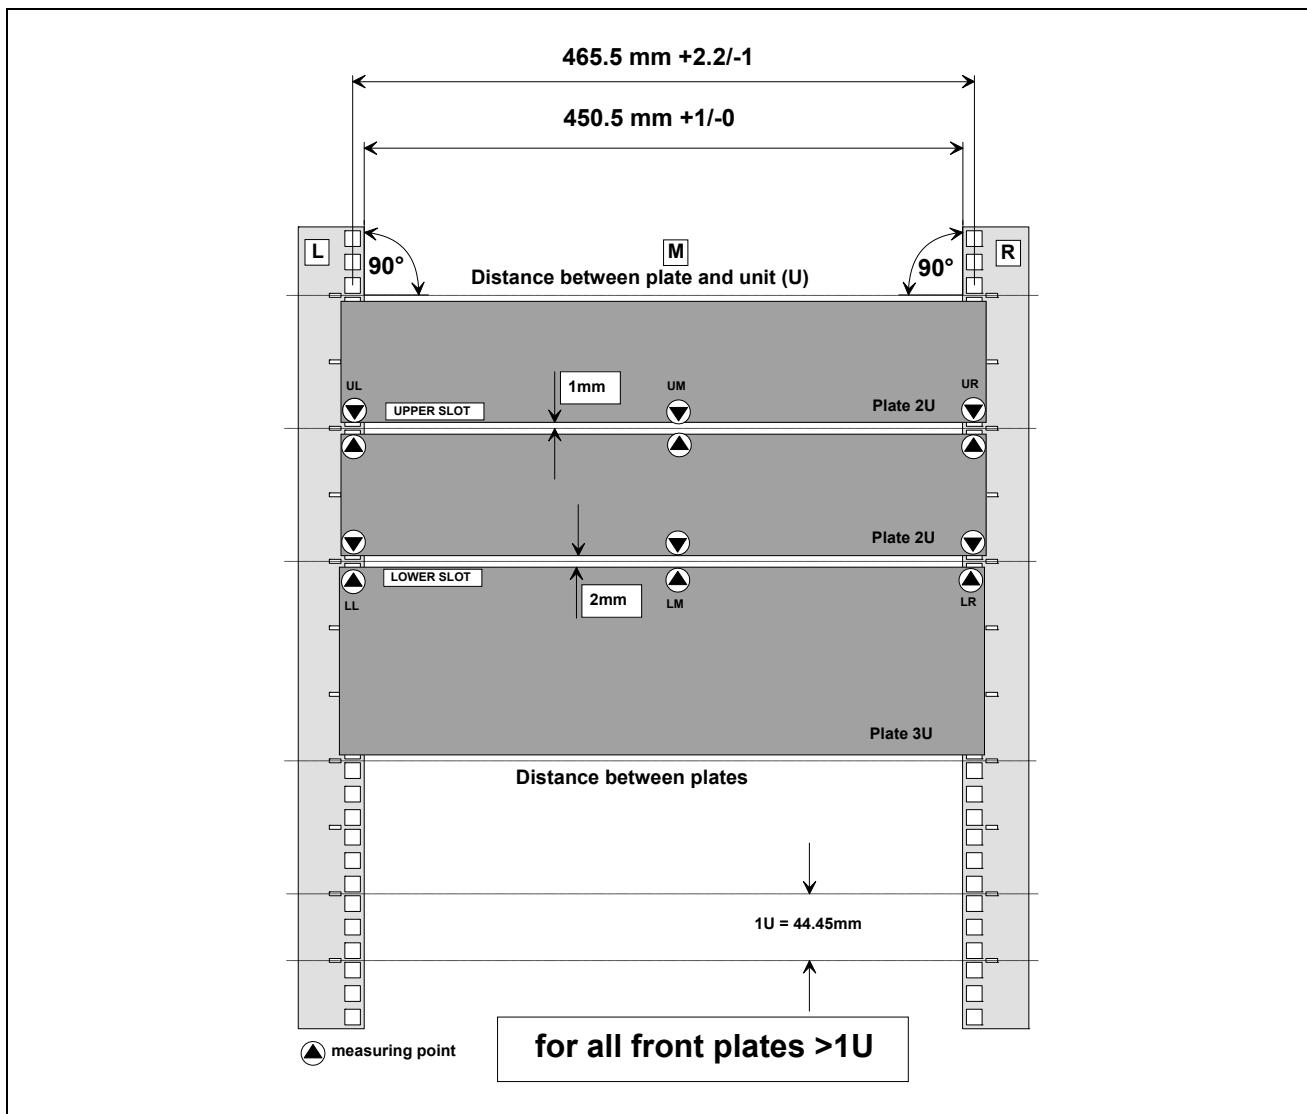

2 Installation dimensions

The dimension that is guaranteed as reliable by all rack manufacturers is the installation width of 19" ($R_w > 450$ mm). So that this dimension can be respected in all cases, the housing width H_w is limited to a maximum of 448 mm for FSC products.

The height dimensions are guidelines for ensuring smooth installation or insertion. They are always relative to the start or the end of a height unit U (1 U = 44.45 mm).

Assuming a space of one U, the following tolerance dimensions exist:

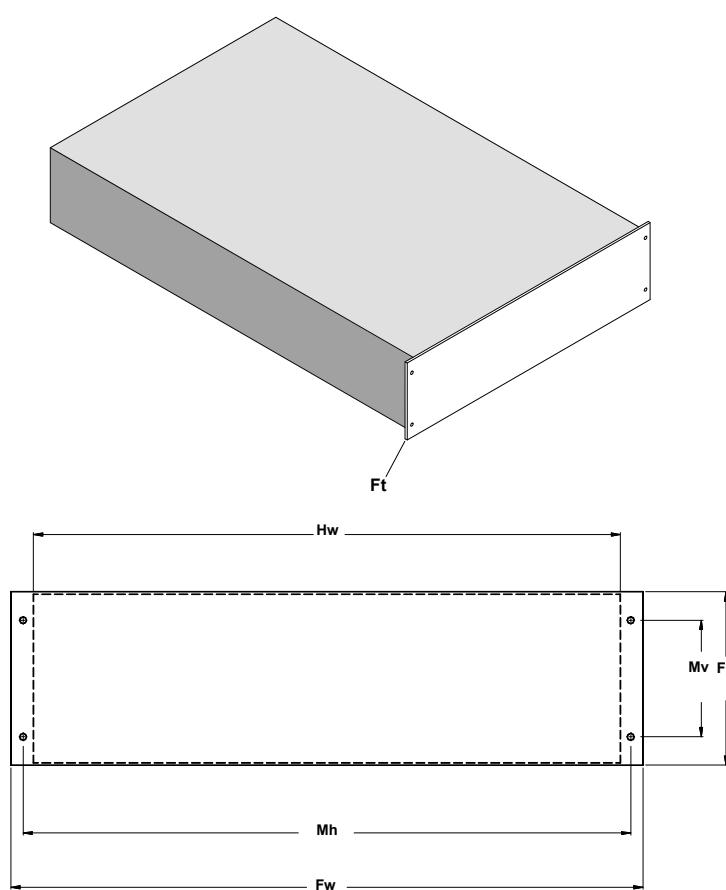

3 Front plate design

3.1 Front plate dimensions, table and drawings

The figure and table below specify the most important dimensions for front plate design.

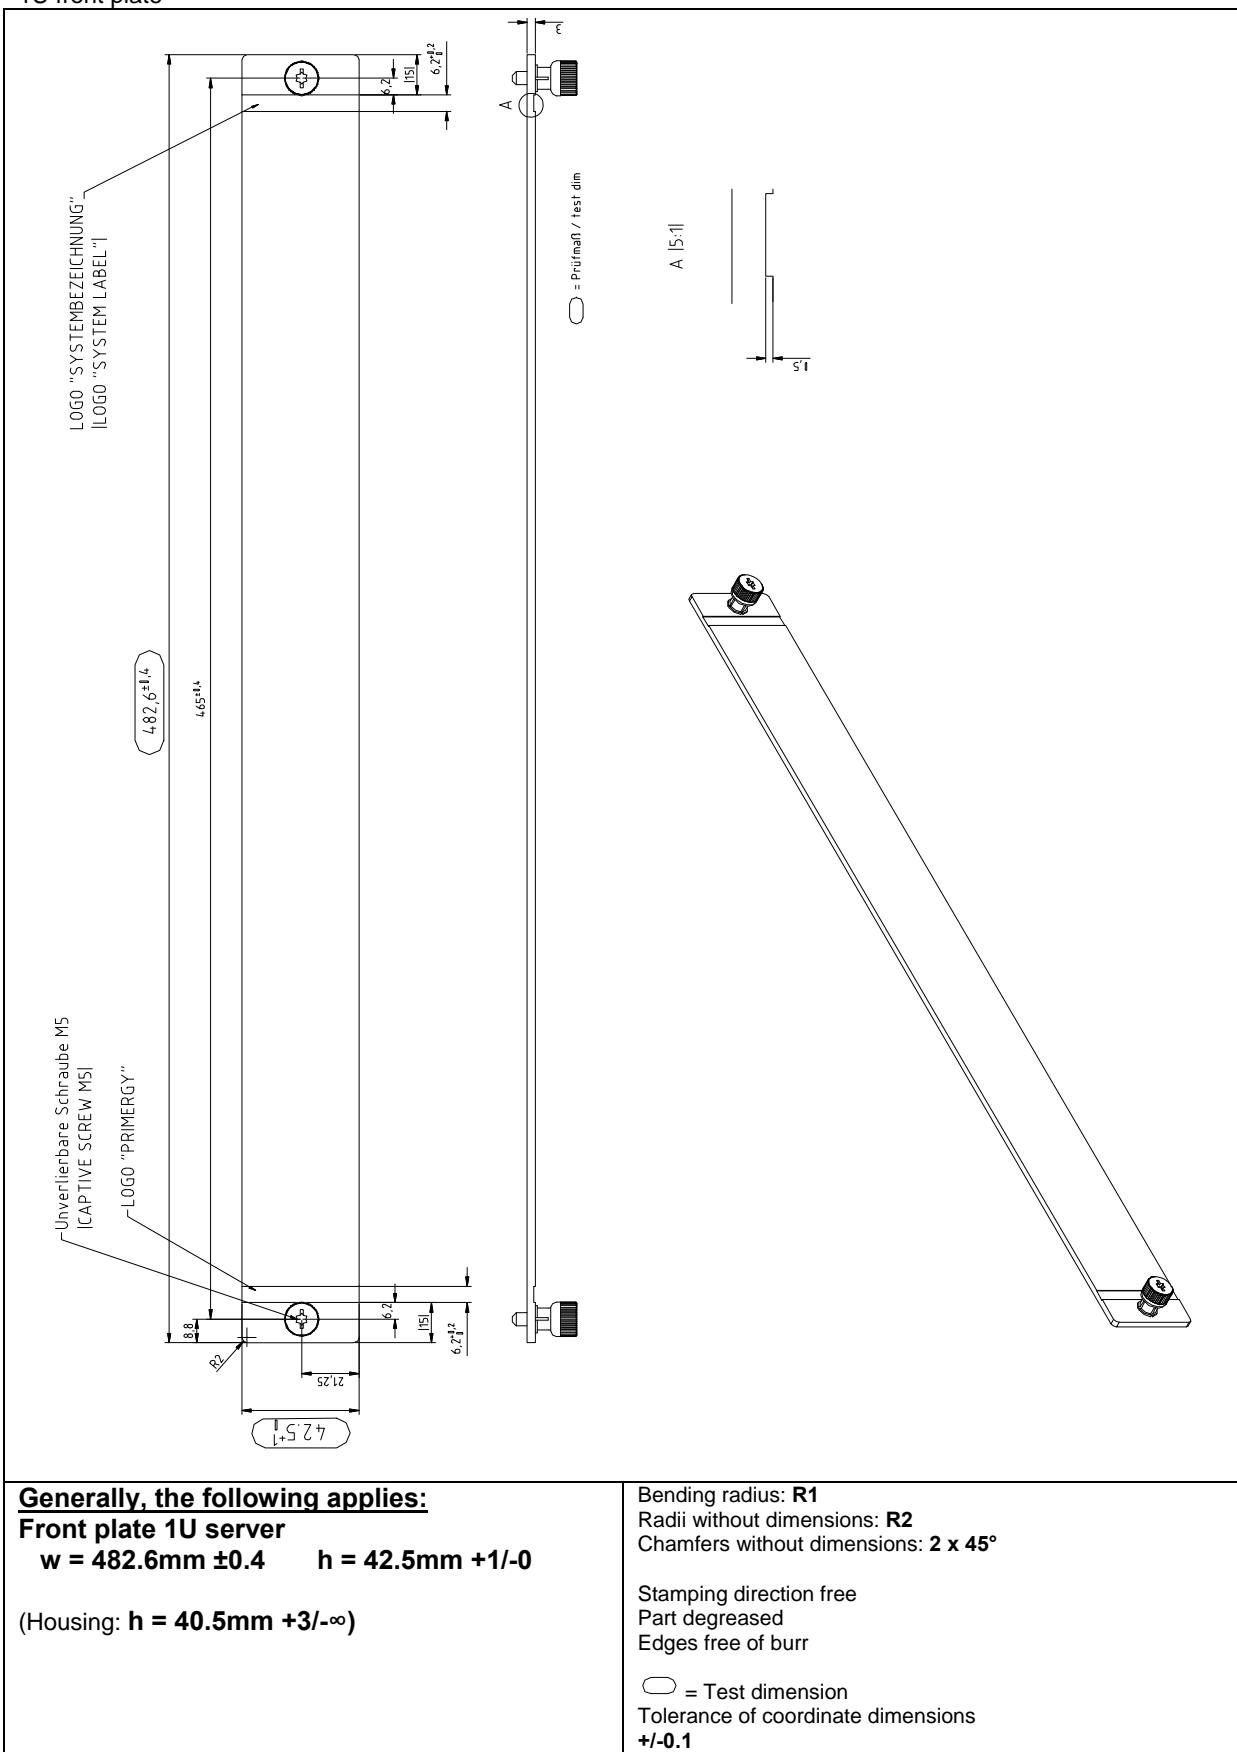

Ft --- Front plate thickness (FSC) = 4mm
Hw --- Housing width = 448mm
Mh --- Distance between the horizontal mounting holes 465.1mm +/-1.6
Mv --- Distance between the vertical mounting holes
Fw --- Front plate width = 482.6mm +/-0.4
Fh --- Front plate height
HE/U --- Height unit = 44.45mm

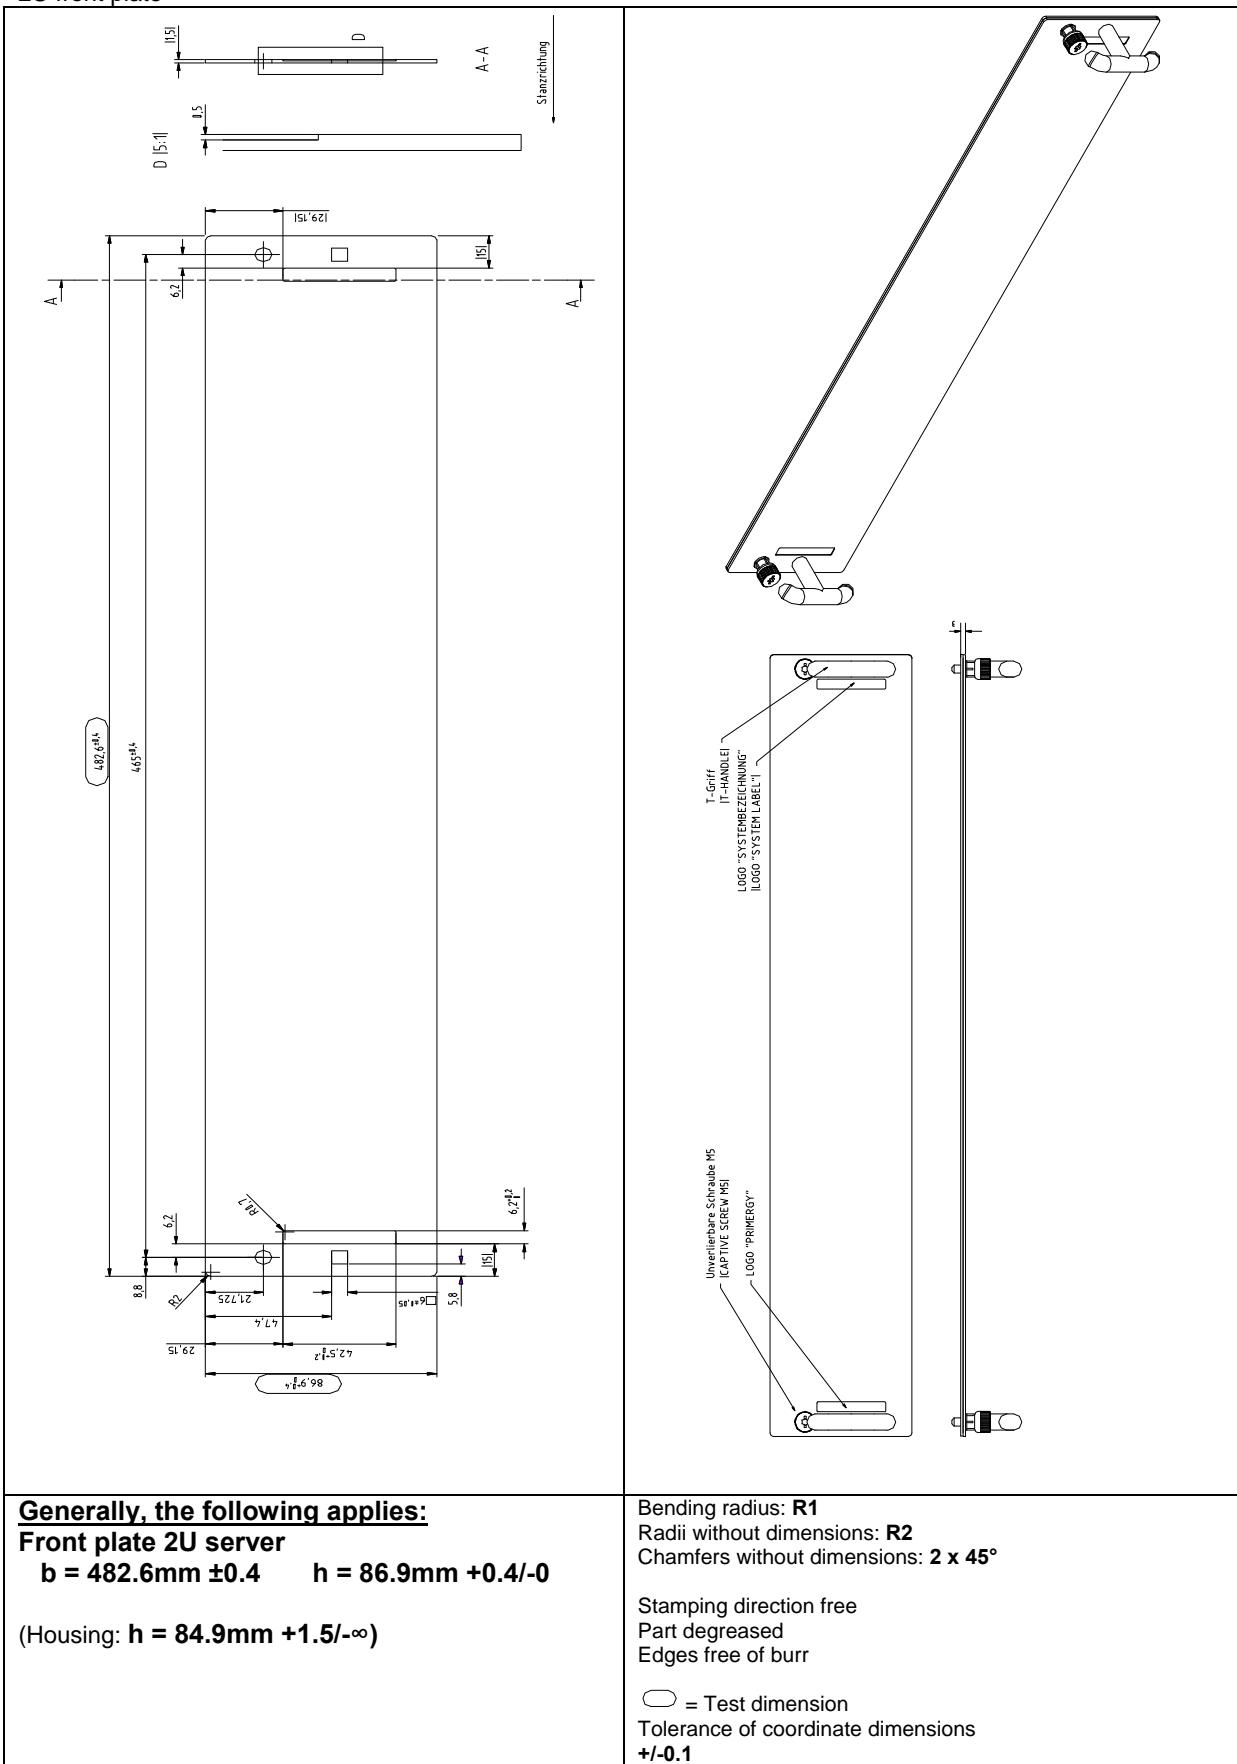

The dimensions of the front plate width and the horizontal mounting holes are defined in accordance with DIN standard 41494.

Table			
HE/U	Fh	Mv	
1 = 44.45	42.5 +/-0	22.22 +/-0.1	
2 = 88.9	86.9 +0.4/-0	44.45 +/-0.2	
3 = 133.35	131.4 +0.4/-0	88.9 +/-0.2	
4 = 177.8	175.8 +0.4/-0	133.35 +/-0.2	
5 = 222.25	220.3 +0.4/-0	177.8 +/-0.2	
6 = 266.7	264.7 +0.4/-0	222.25 +/-0.2

3.2 19-inch dummy panels / blind plates

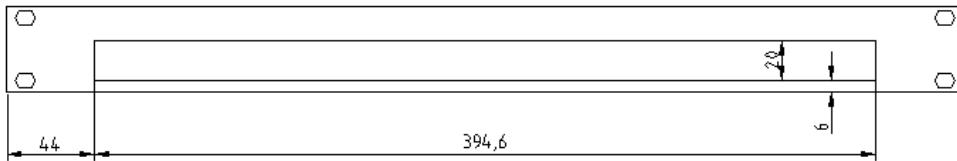

Front plates are also available as so-called covers, dummy panels or blind plates for closing empty bays and slots in the rack. This is mandatory to ensure proper ventilation of the installed servers in the rack.

By default the following cover plates are available:

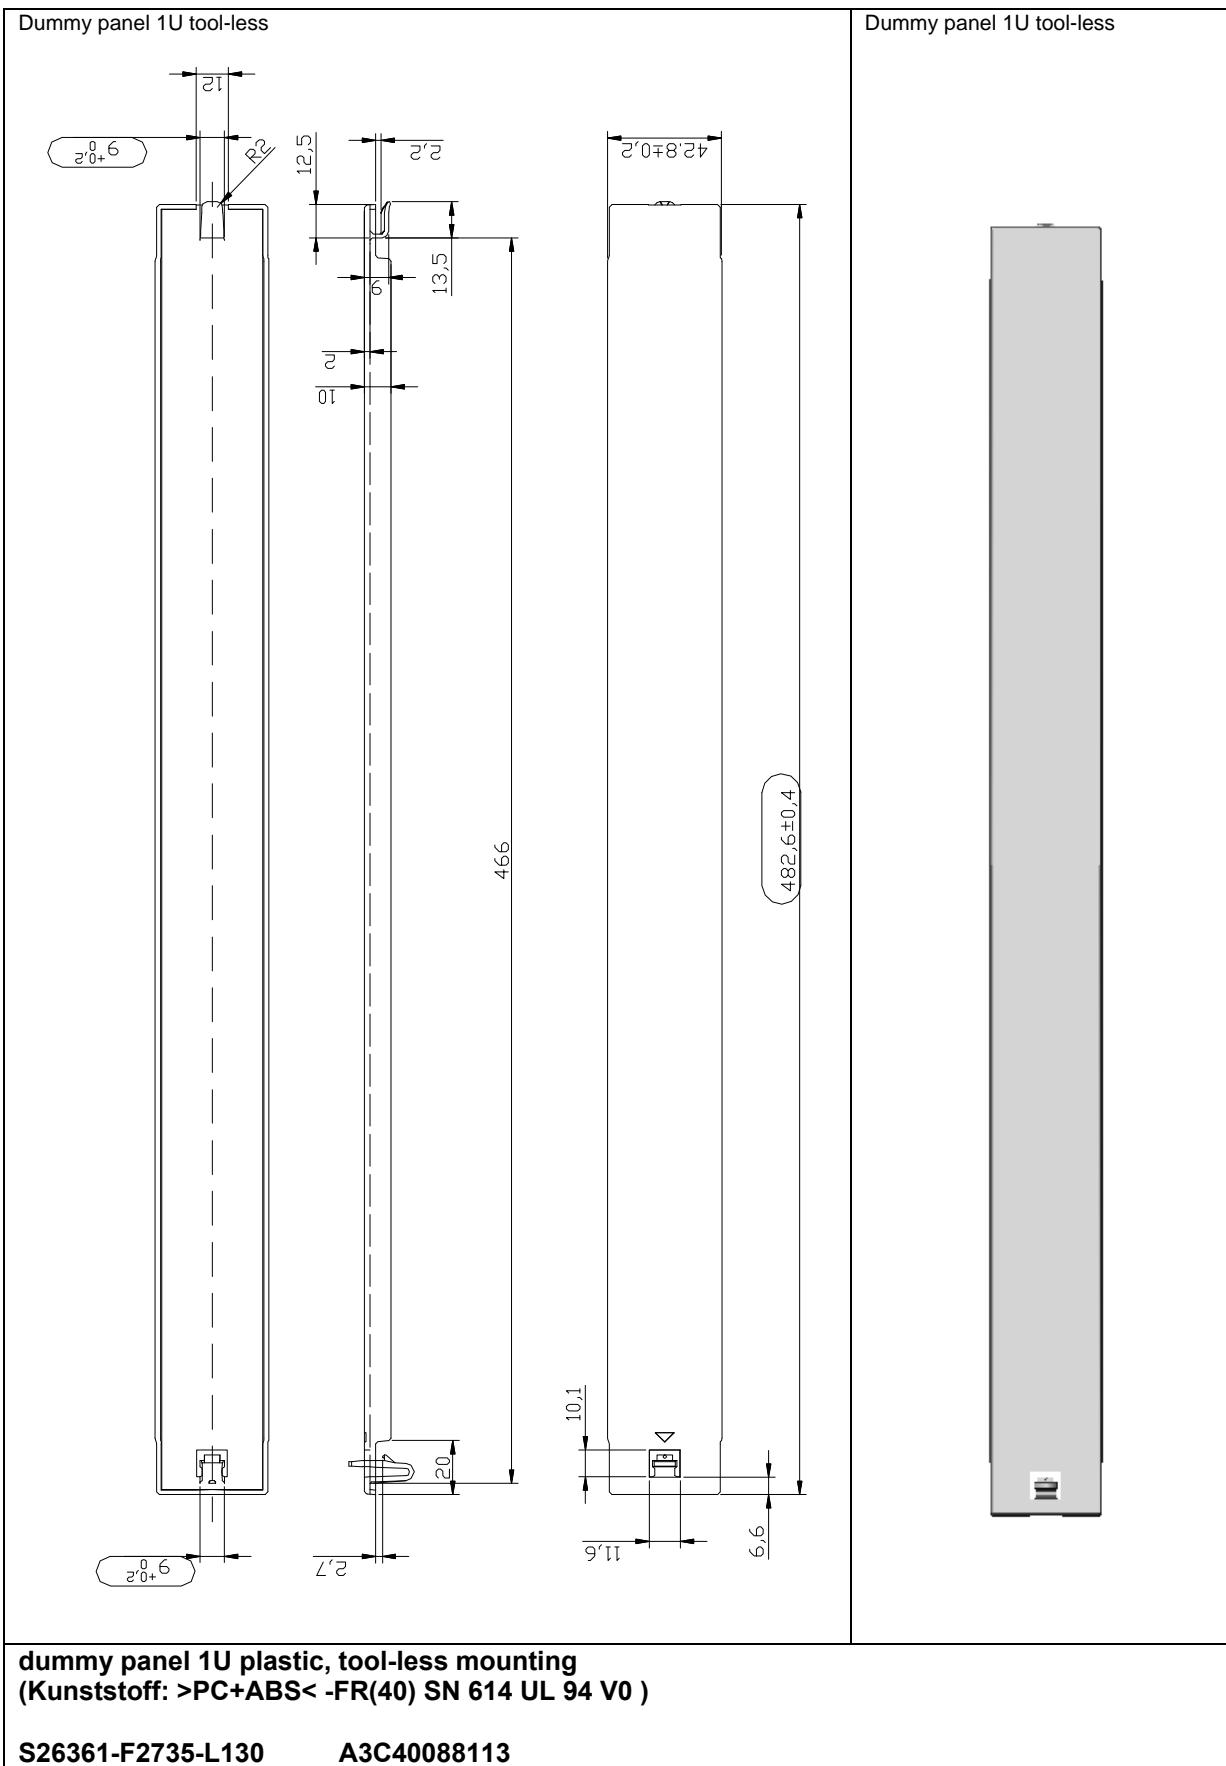

19" Kabdurchführung 1HE mit Bürsten

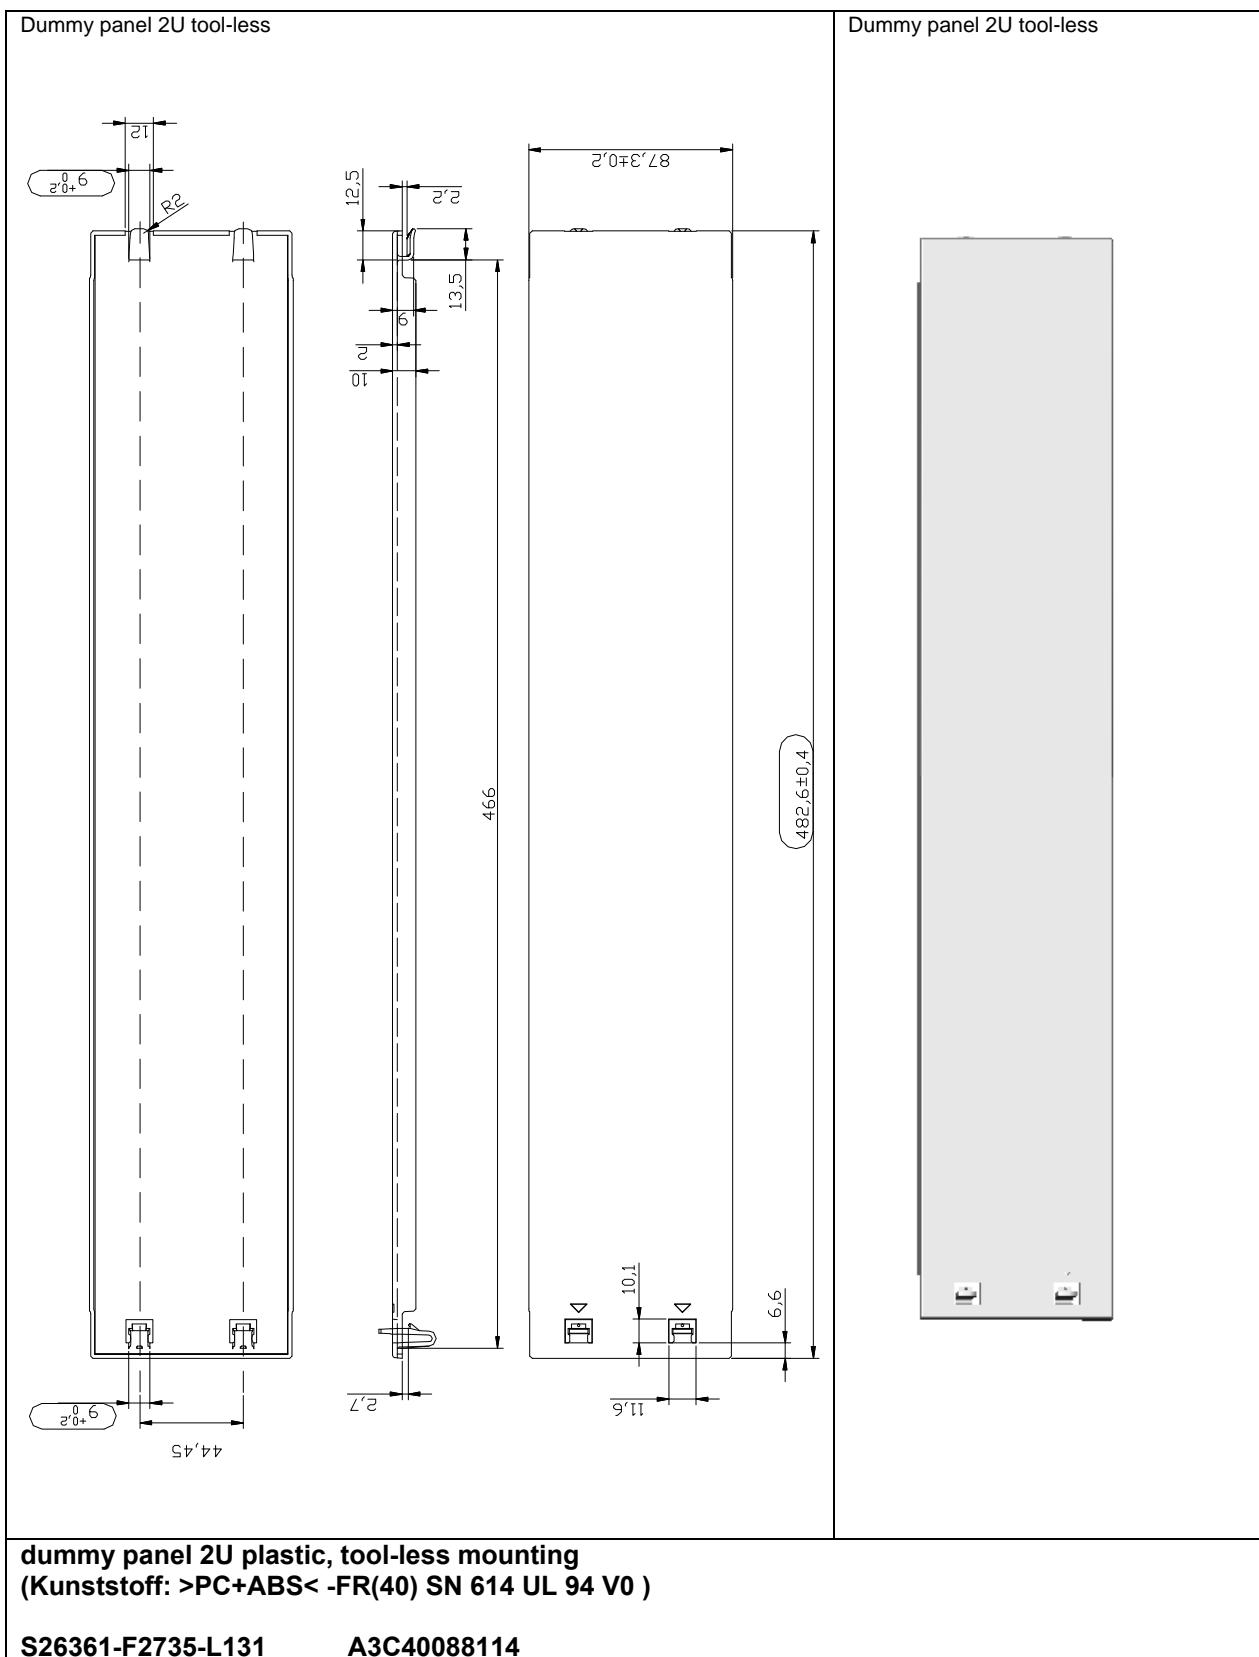

19" Kabdurchführung 1HE mit Bürsten

19" cable bushing 1U with strip
S26361-F2735-E25; S26361-F2735-L25

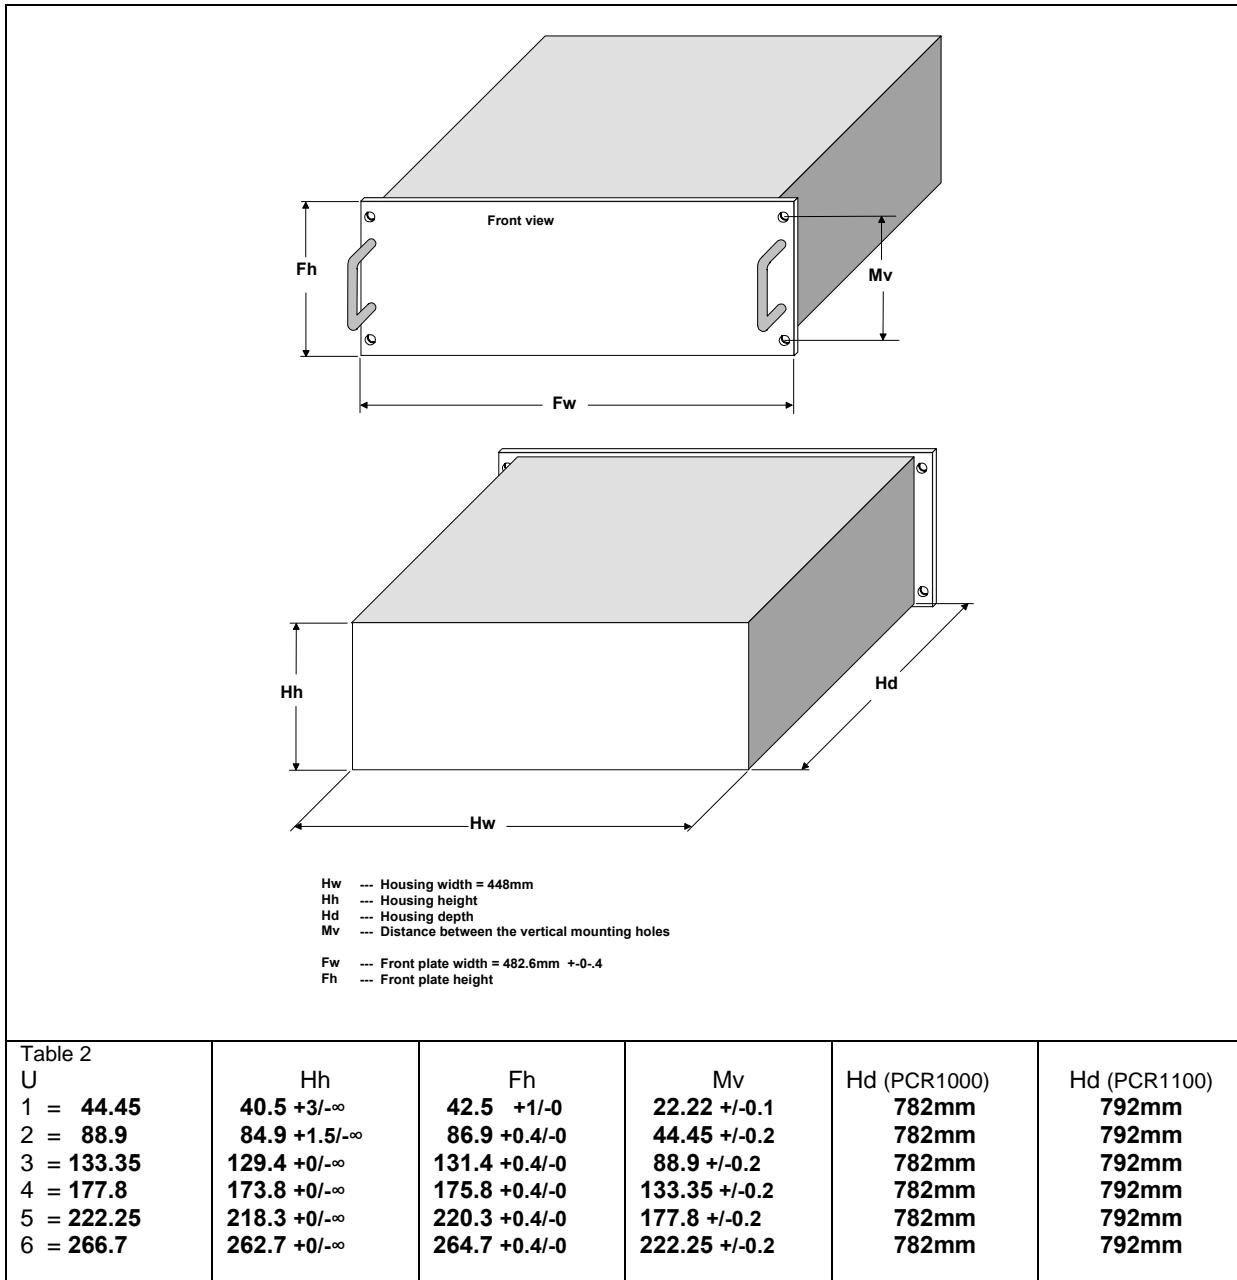

4 19-inch housing

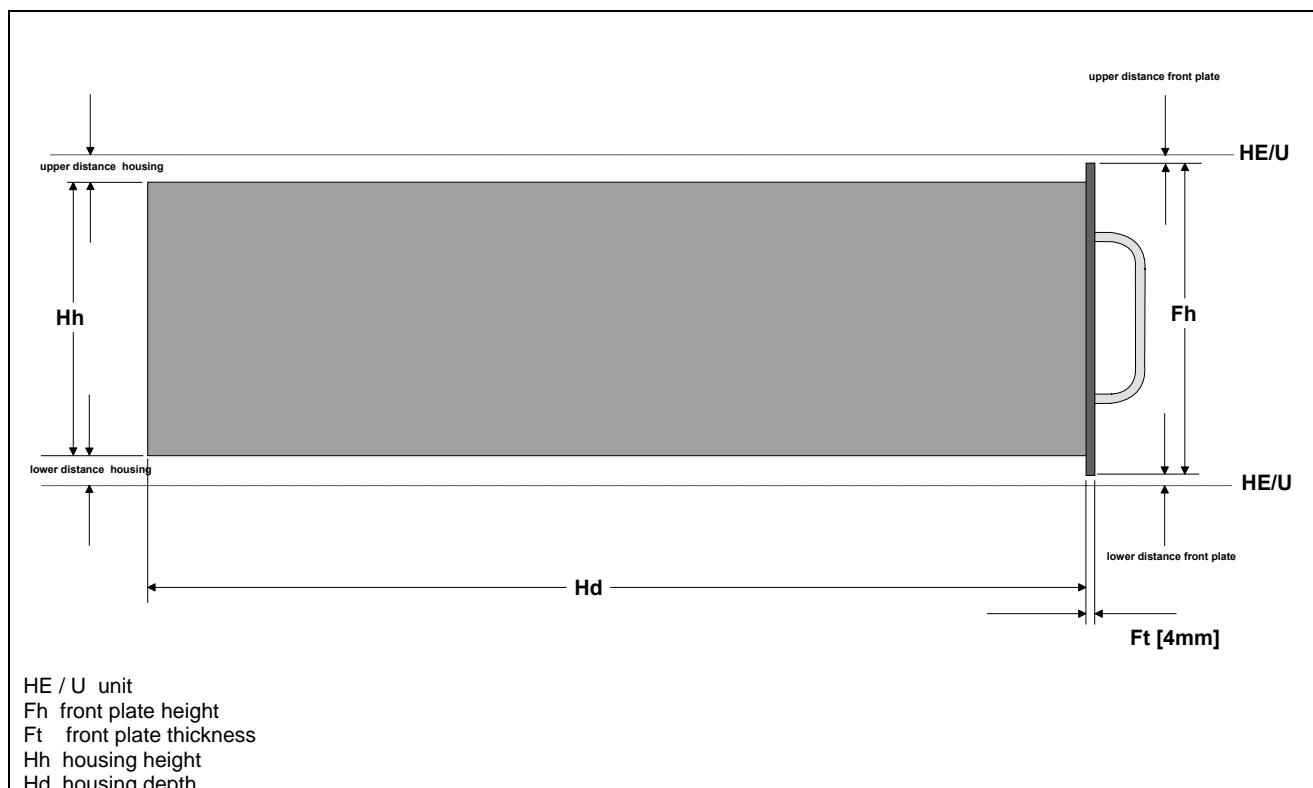

The term 19-inch housing refers to all system installation components of this format.

4.1 19-inch housing dimensions

The form and the housing depth depend in each case on the corresponding carrier system and the rack (installation depth) into which the housing is installed. This chapter will not consider these factors but will only show the theoretical limits. For more information see the sections on rack types and carrier systems.

Note: 1U 19-inch housings are subject to slightly different special rules concerning the distance between the housing top and bottom and the height unit.

5 PRIMECENTER rack family

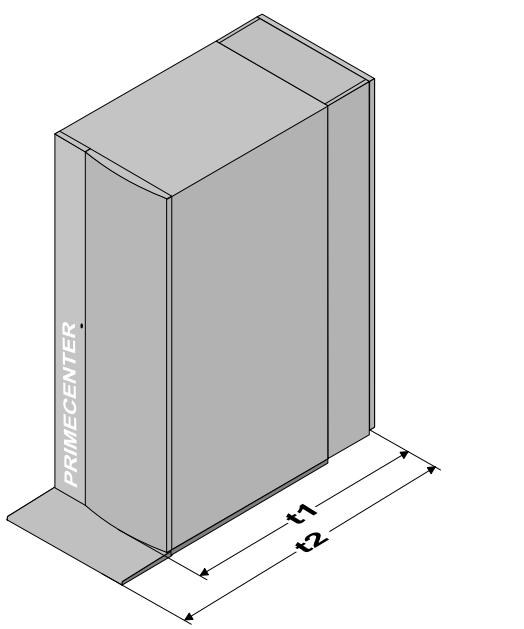

This chapter describes the different FSC rack types with their installation dimensions and requirements.

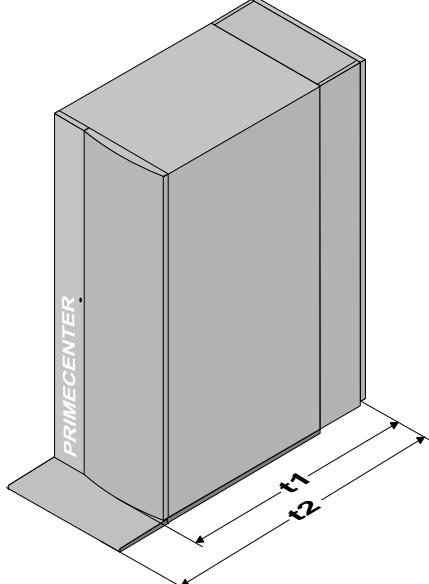

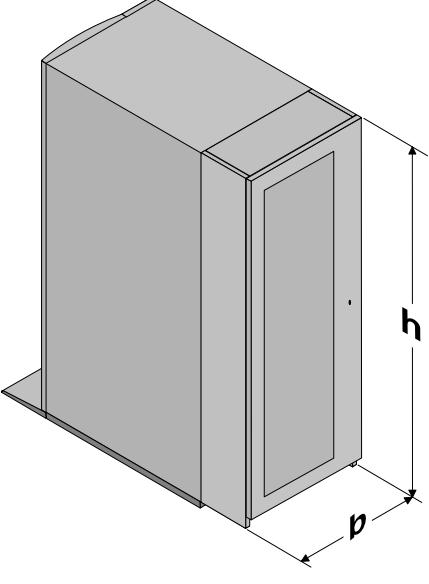

PRIMECENTER rack family

*The figure does not show the 48 U rack ((Should there be a corresponding asterisk in the text or is this just a note?))

7 System cabling strategy

7.1 PCR rack cable manager

The cable management element is a patented component of Fujitsu Siemens Computers and Knürr. It is used in the DataCenter and PRIMECENTER racks. Unlike conventional cable guides, the cable management is an integral part of the rack and not of the systems that are installed in the rack. This means it can be mounted in the rack types listed above for any assembly from any manufacturer \geq 2 height units. The articulated cable guide can be mounted in a 1U grid. This compatibility allows consistent rack cabling.

The functional principle is based on an articulated cable guide which is mounted on a carrier plate in such a way that it can be folded in and out. The articulated cable guide follows the installed rack components half-way. The cables are routed in the comb-like cable guide and screwed to the system component.

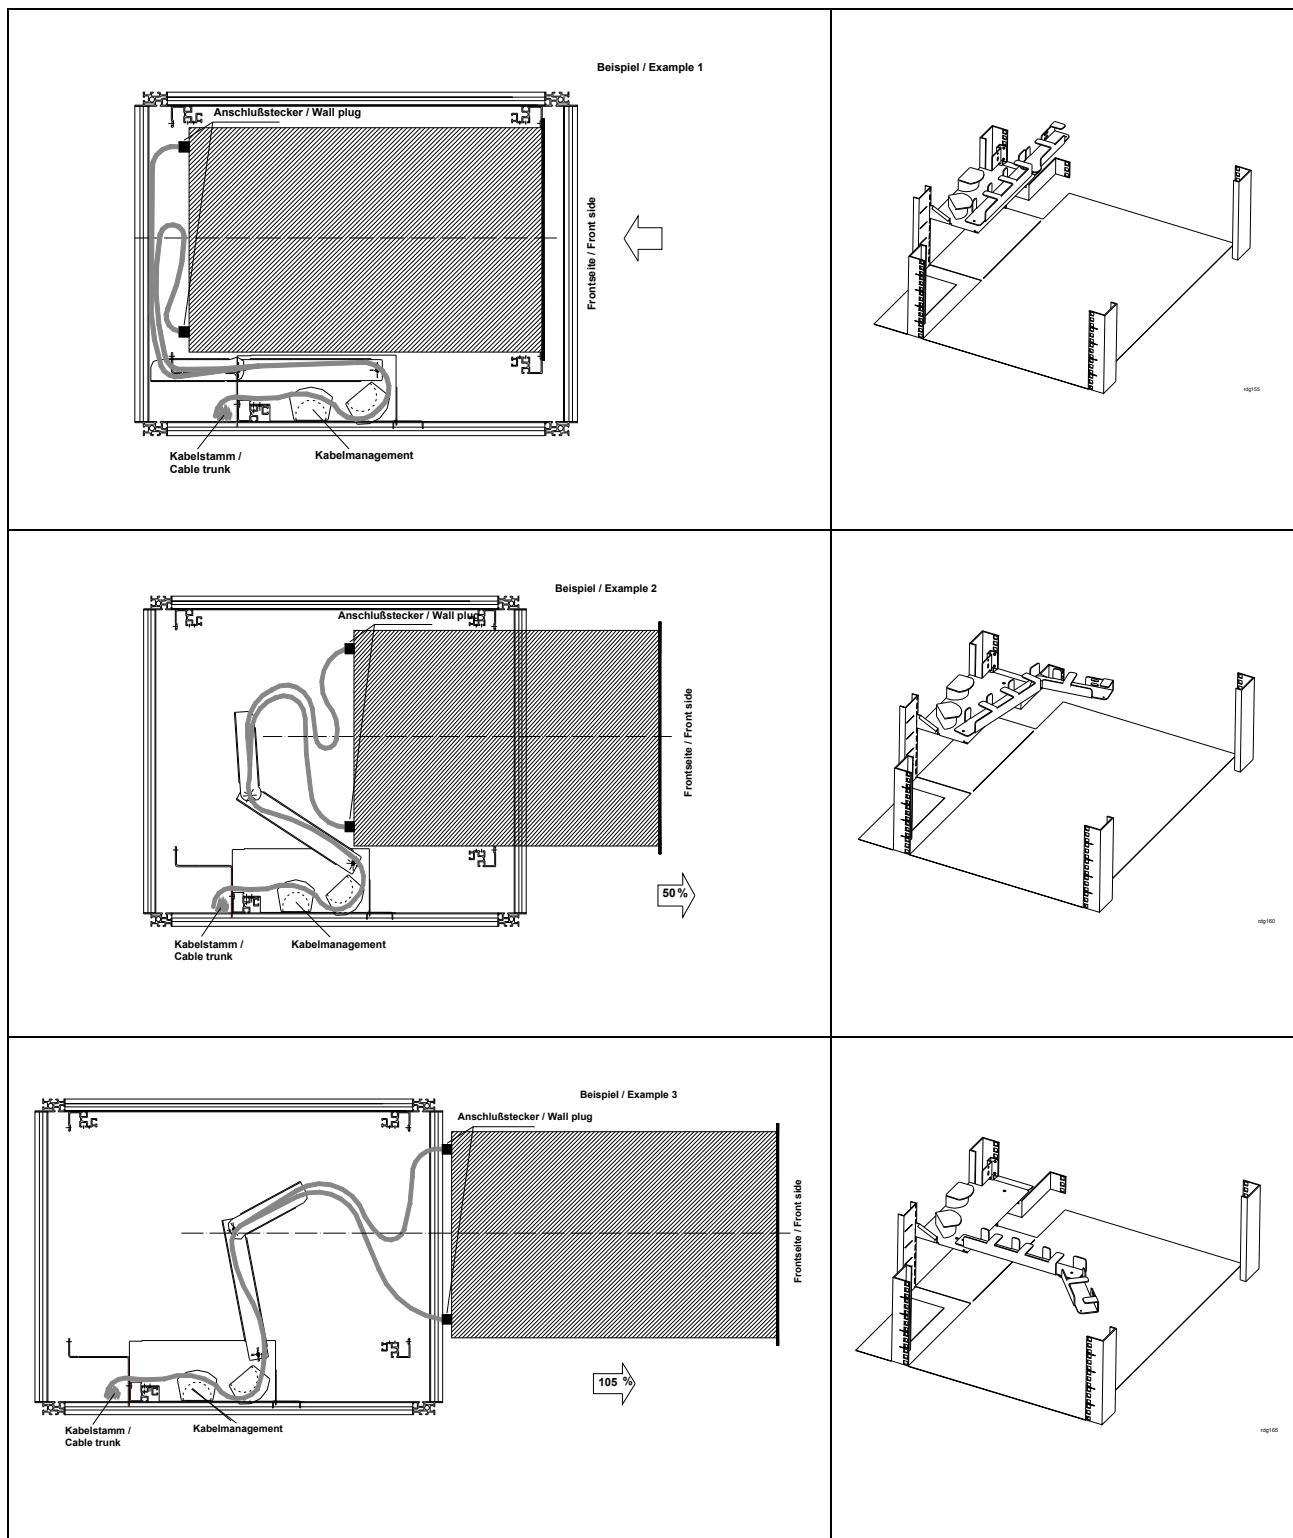

7.1.1 Figures

8 Carrier system

8.1 Basics

As well as in a fixed installation, the 19" rack components can also be mounted on sliding or telescopic rails which allow them to be pulled out of the rack. The ball-bearing telescopic rails are available in two different versions.

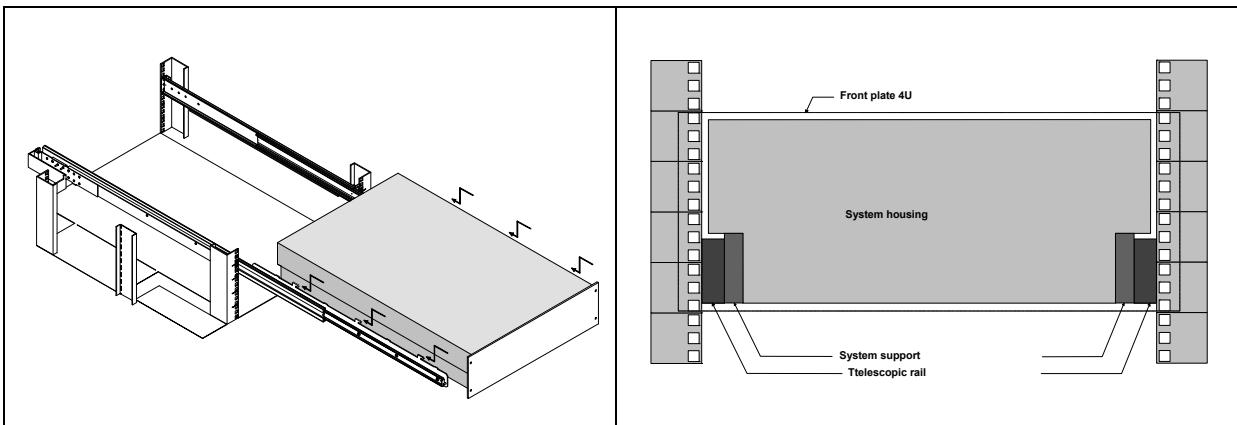

8.1.1 Extension type

	
<p>Telescopic rail – full extension: The telescopic rail has three main components (inner, center and outer rail). Extension depth >105%</p> <p>Telescopic rail full extension >105%</p> 	<p>Telescopic rail - partial extension: The telescopic rail has two main components (inner and outer rail). Extension depth approx. 50%</p> <p>Telescopic rail partial extension</p> 
Full extension	Partial extension

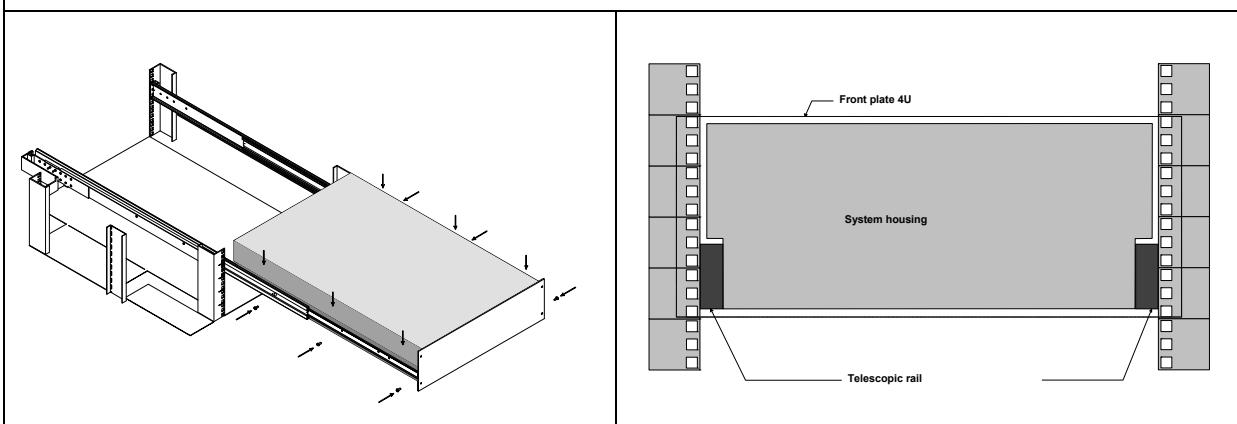

8.1.2 Mounting the system on telescopic rails (installation examples)

There are three primary ways of mounting systems on telescopic rails:

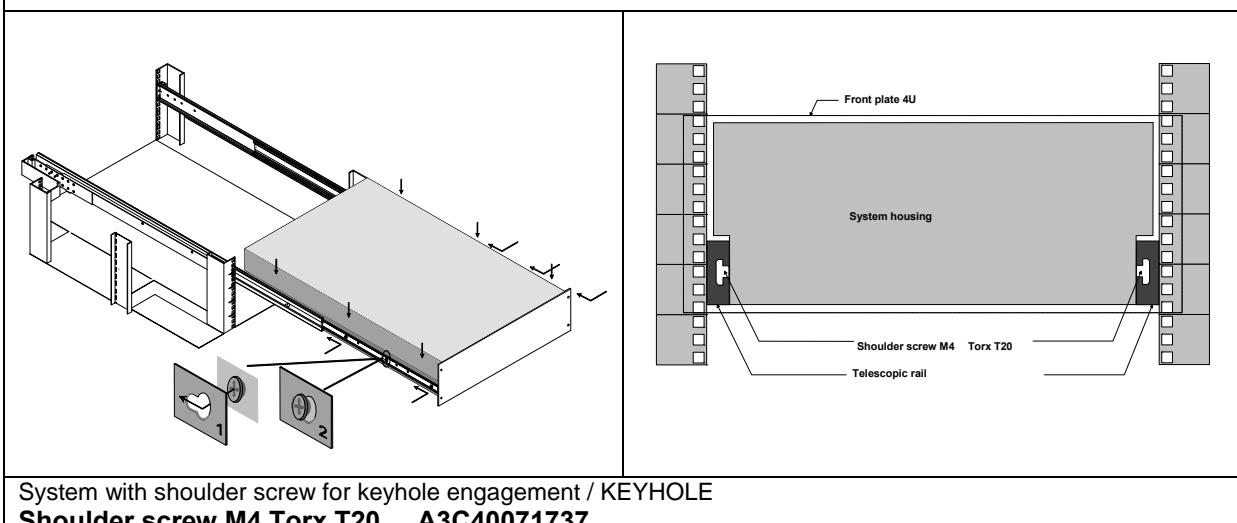

1. Sliding the system onto a system support plate and securing it.
2. Screwing the system directly to the inner telescopic rail. In this case, you replace the system by separating the rails.
3. There are shoulder screws on the system housing which engage in the keyholes of the inner telescopic rail.

System mounted on system support plates (high safety during mounting!)

System screwed directly to the telescopic rail

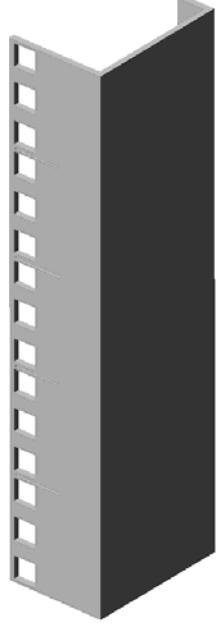

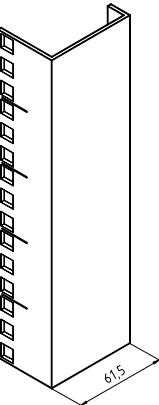

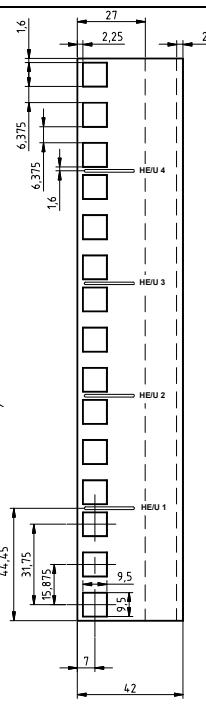

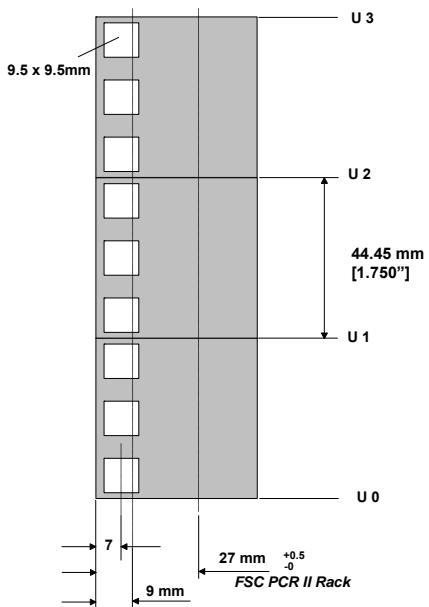

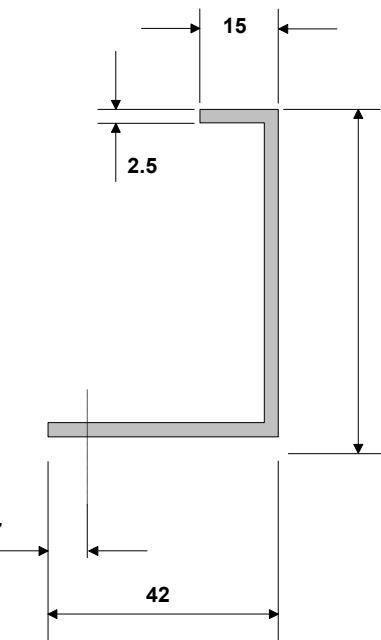

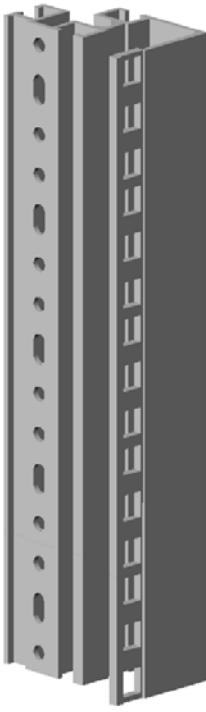

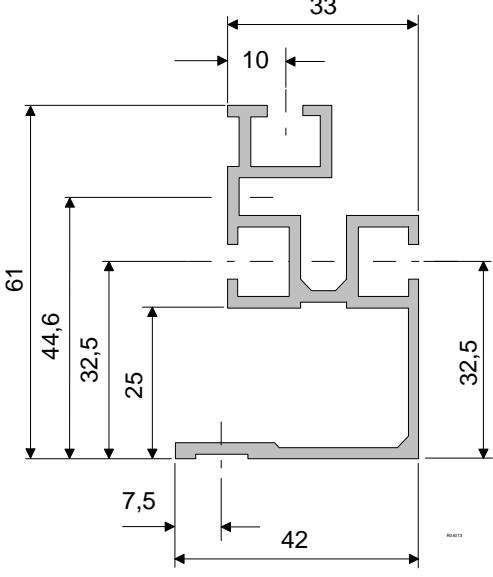

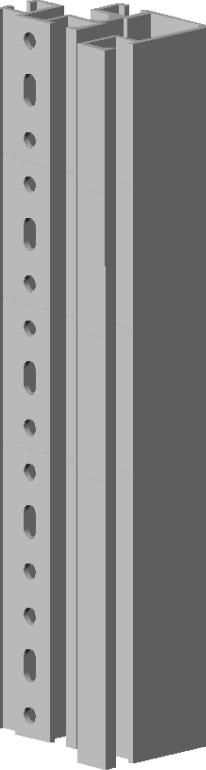

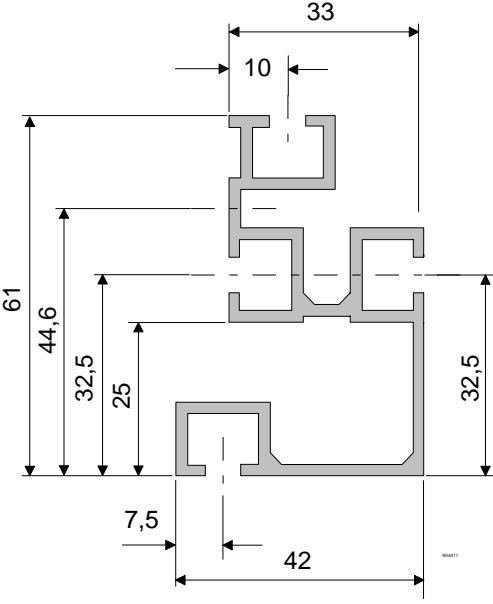

**System with shoulder screw for keyhole engagement / KEYHOLE
Shoulder screw M4 Torx T20 A3C40071737**

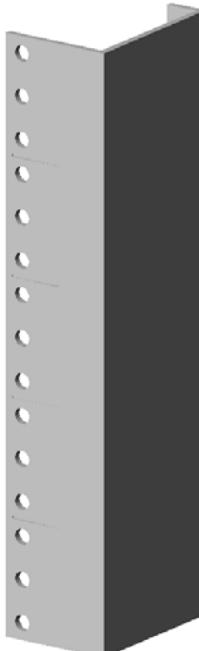

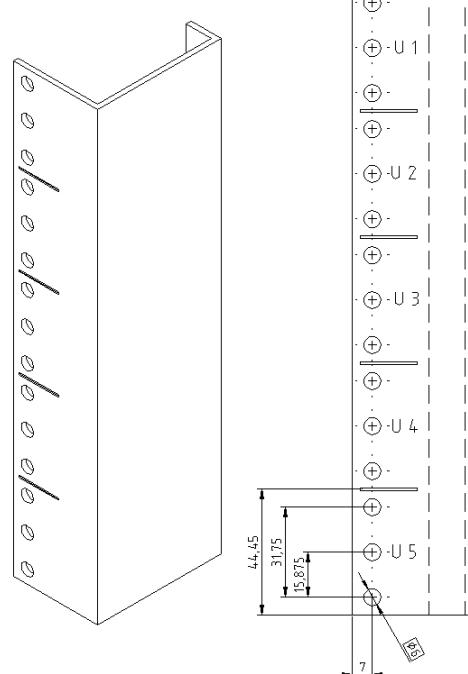

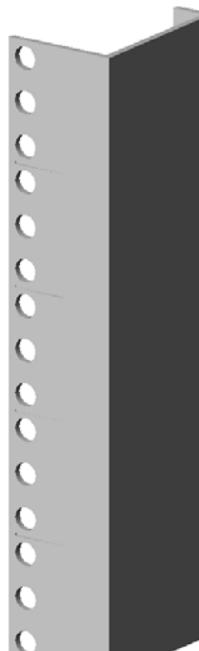

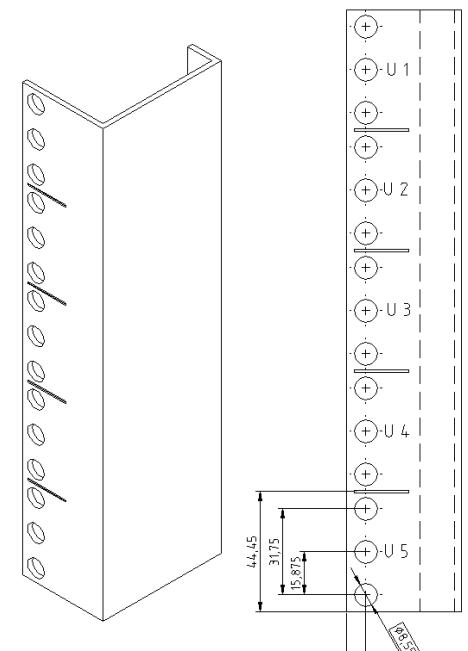

8.1.3 Basics of the structural design of the carrier systems for FSC, Fujitsu and third-party racks

A basic requirement for designing carrier systems is compliance with the EIA-310-D 19-inch standard and information on the different carrier profiles on the market.

8.4 Sliding rail

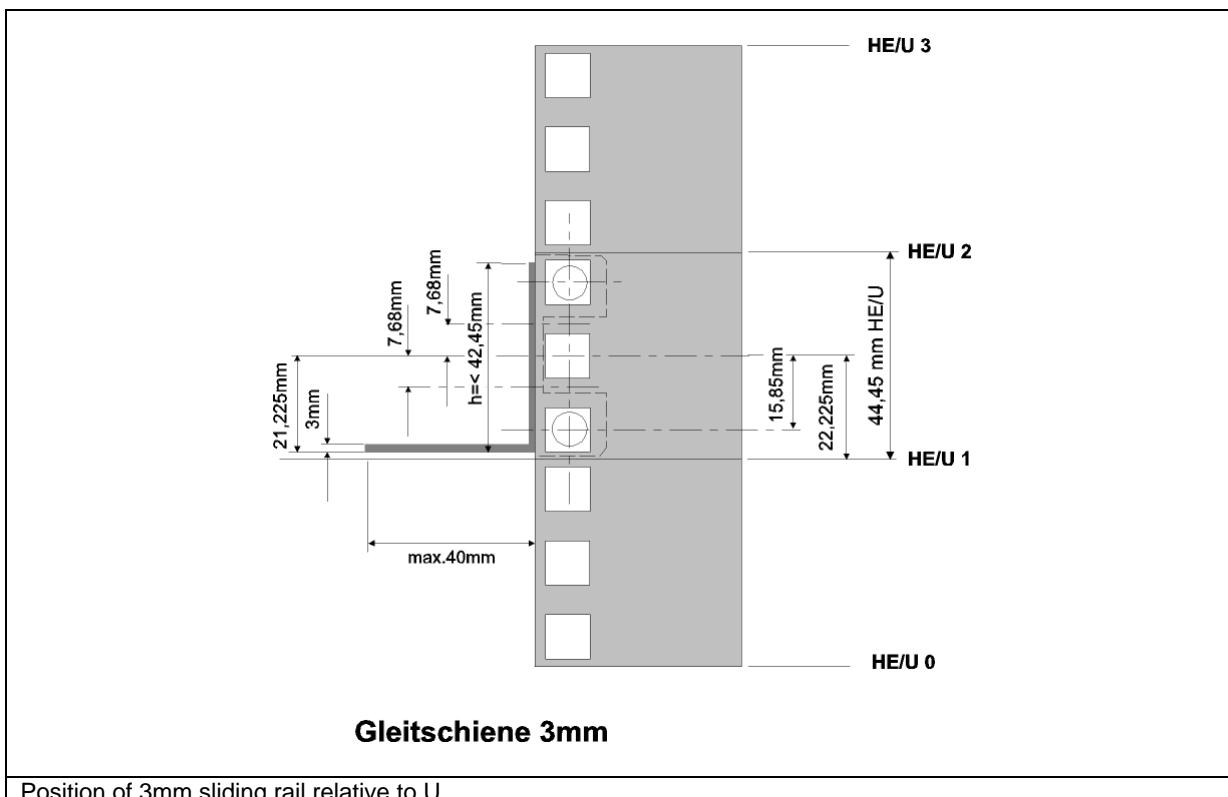

Sliding rails are used for static installation of rack components which are completely removed from the rack for service and maintenance. They do not allow the component to be pulled out completely and, in special cases, provide tilt protection and a stopper. Based on the Vario carrier, they are designed as different versions for the specific areas of use.

8.4.1 1.5mm sliding rails (design example 1)

Position of 1.5mm sliding rail relative to U

8.4.2 3mm sliding rails for heavier load (design example 2)

Position of 3mm sliding rail relative to U

Two universal mounting plates are available for mounting different multiple-socket outlets. They can be mounted in the 19-inch grid and in any free position on the spring grooves of the carrier profiles.

10 Appendix

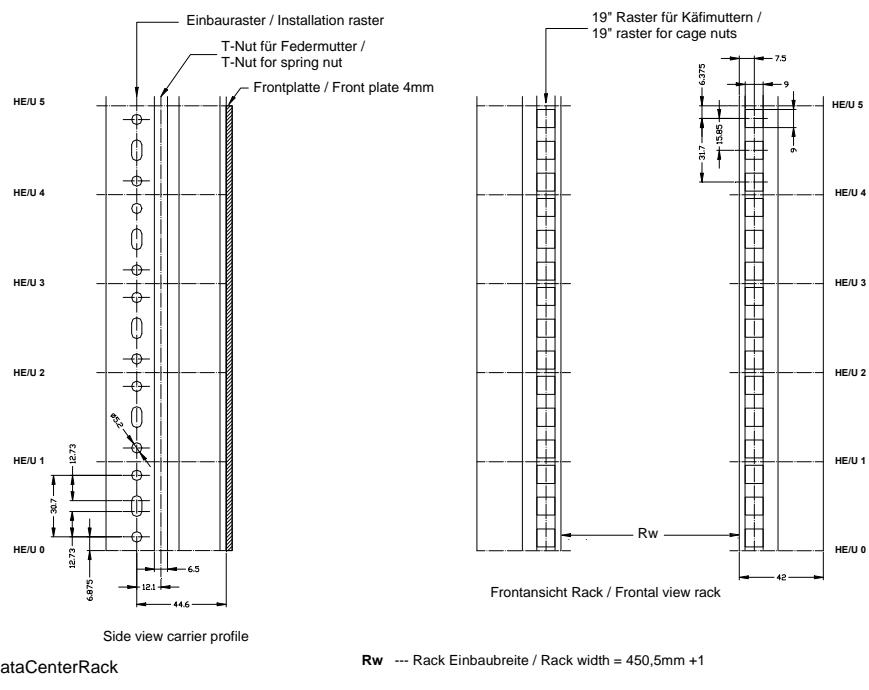

10.1 Third-party racks / older racks (structure and dimensions)

10.1.1 DataCenter Rack

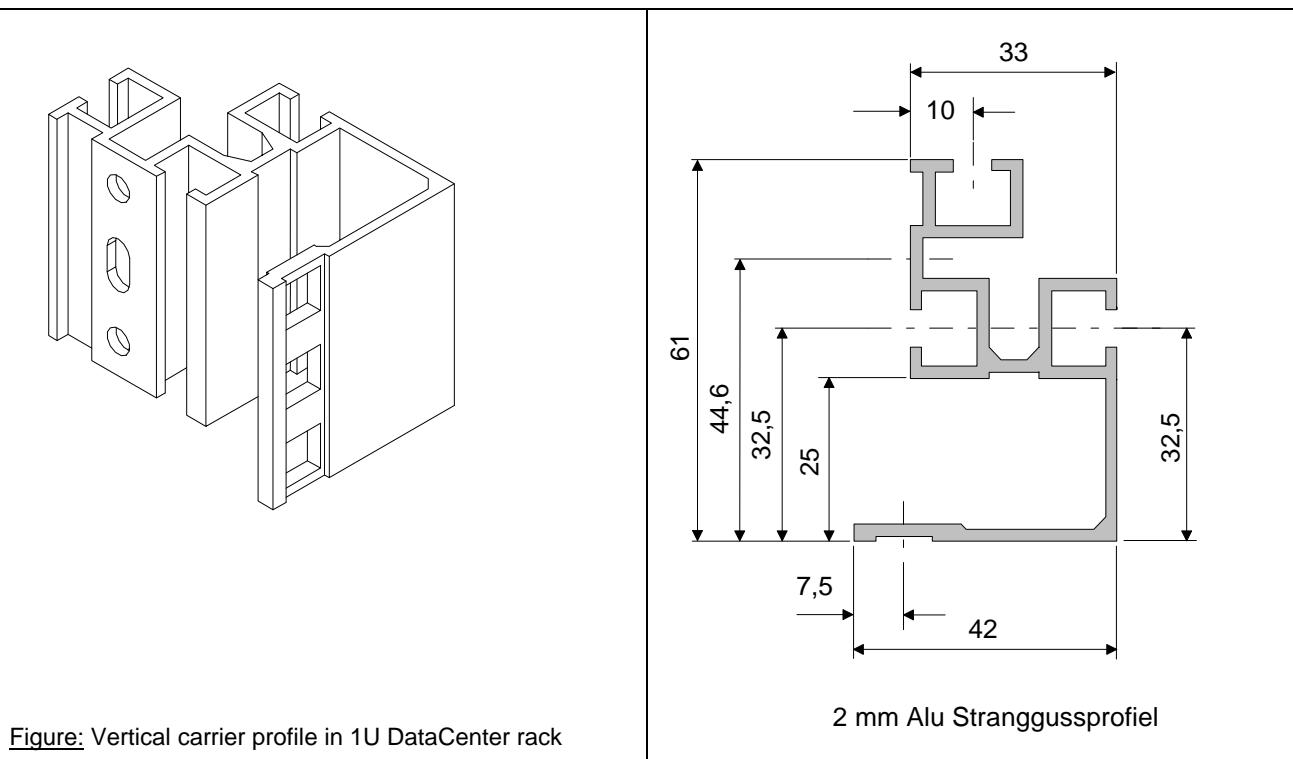

Since 2002, the DataCenter rack (depth: 900mm) has been the standard rack for PRIMERGY servers in the FSC portfolio. At the end of 2002 it was replaced by the PRIMECENTER S2 rack and was available in the following versions:

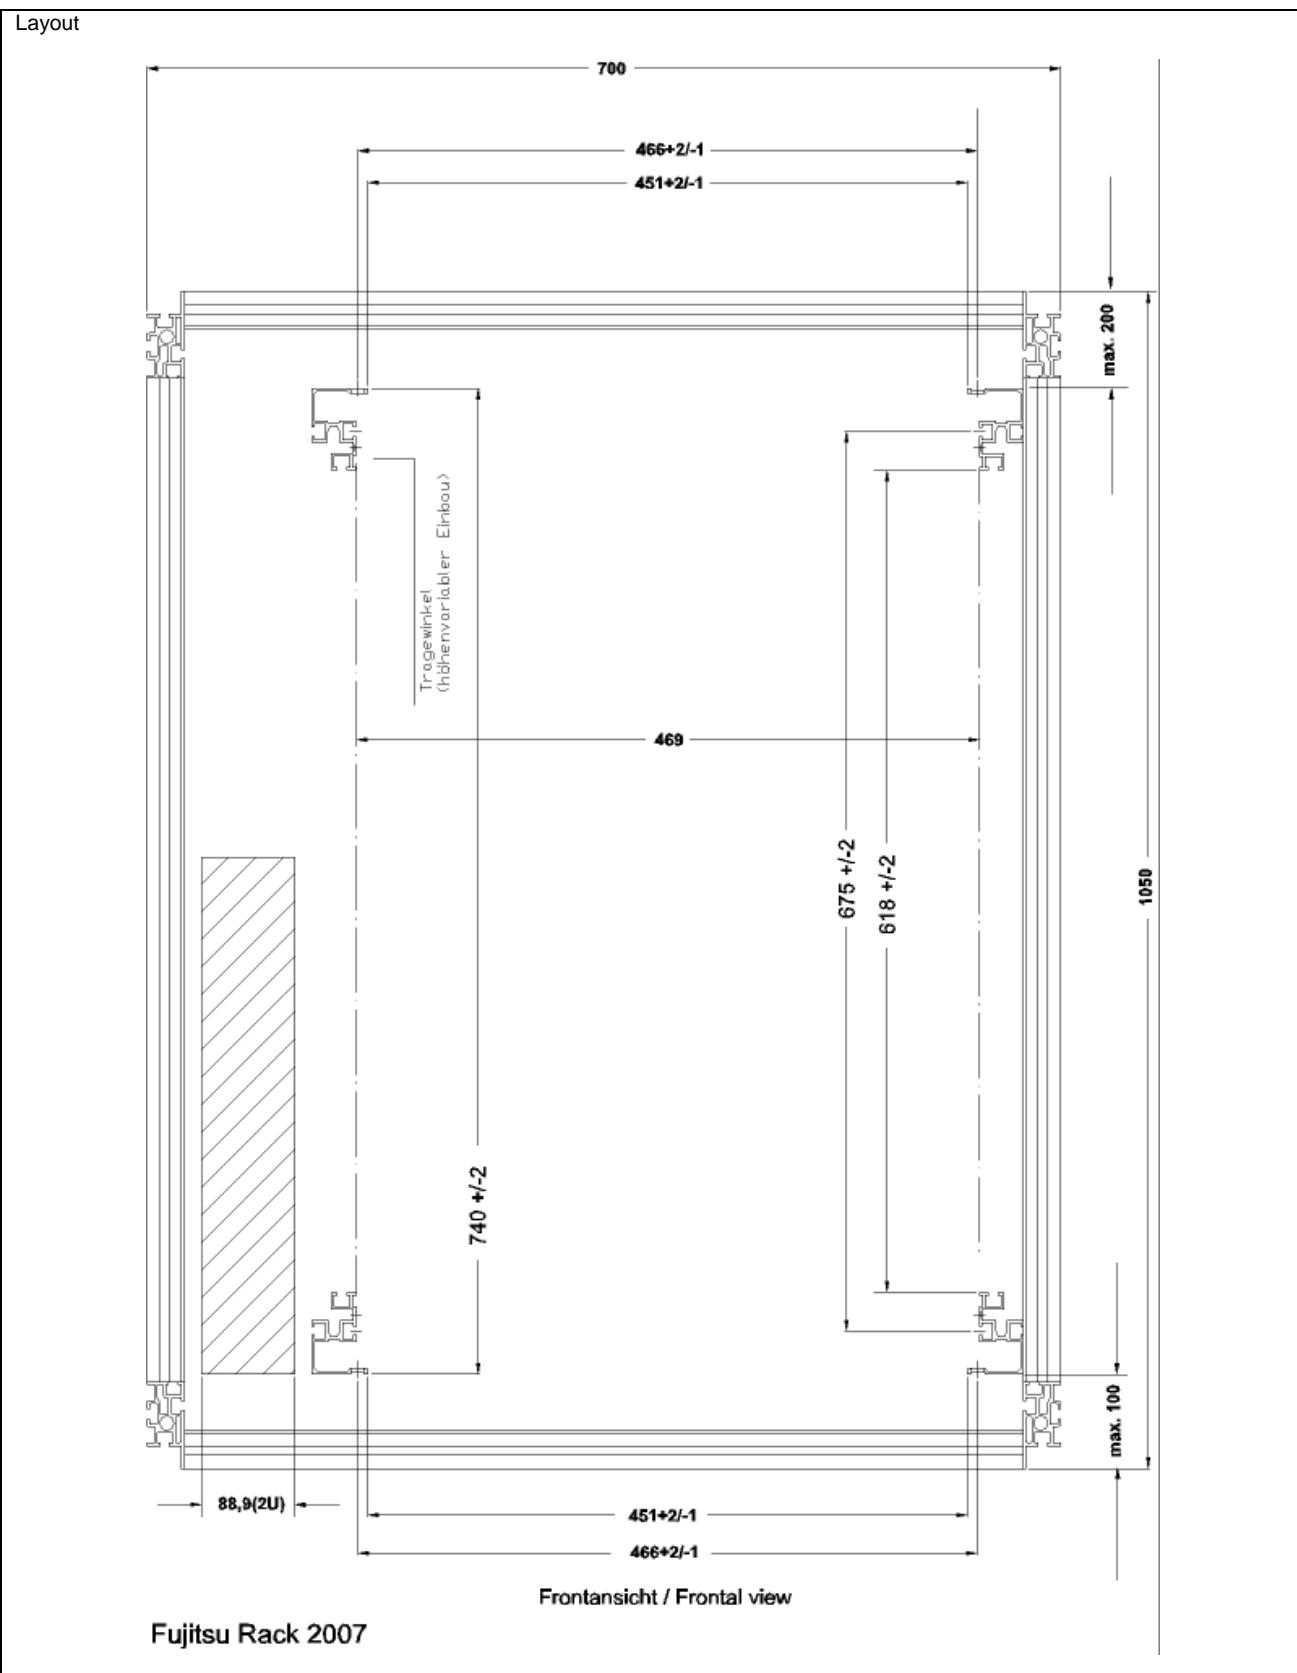

Carrier profile

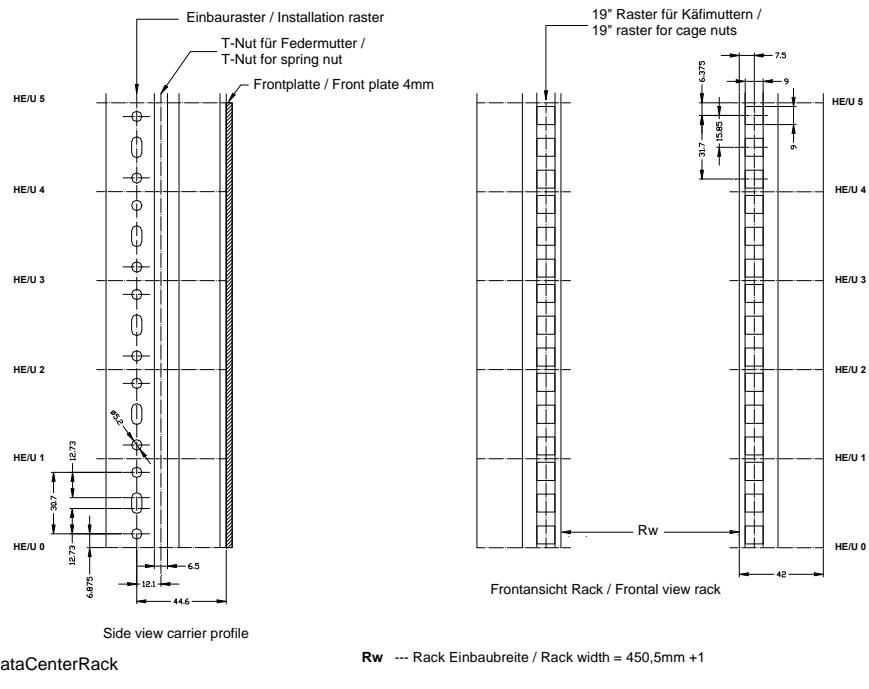

rdg006b

10.1.2 Fujitsu rack

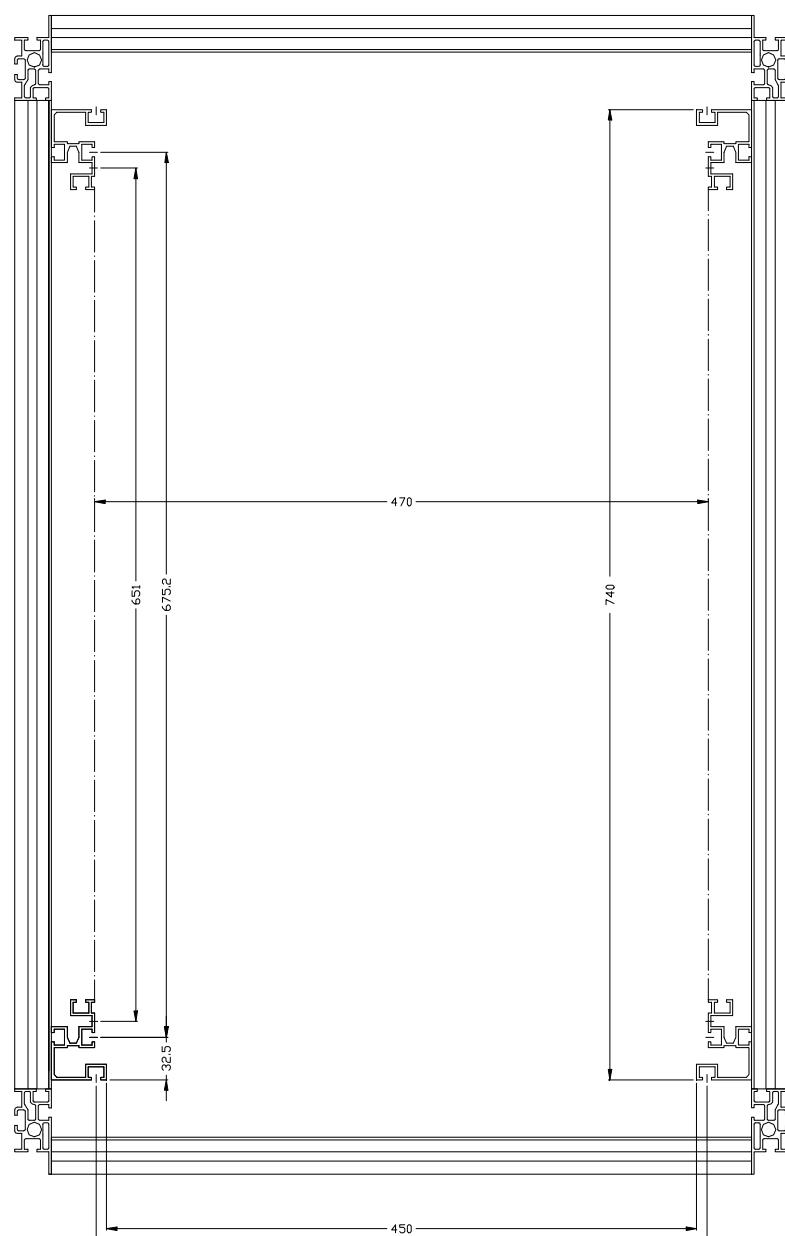

Carrier profile

10.1.3 Classic rack

The Classic rack is based on the **Miracel** rack system from the company Knürr AG. It was the first standard rack in the FSC portfolio for integrating 19-inch components. In 2000, it was replaced by the DataCenter rack.

10.1.4 PRIMECENTER S1 Rack

The PRIMECENTER S1 rack was developed by FSC and was the standard rack for RM systems, BS2000 and Primepower servers for several years. At the end of 2002 it was replaced by the PRIMECENTER S2 rack.

10.2 Adapter kits

10.2.1 Carrier systems from Classic rack -> PCR and third-party racks

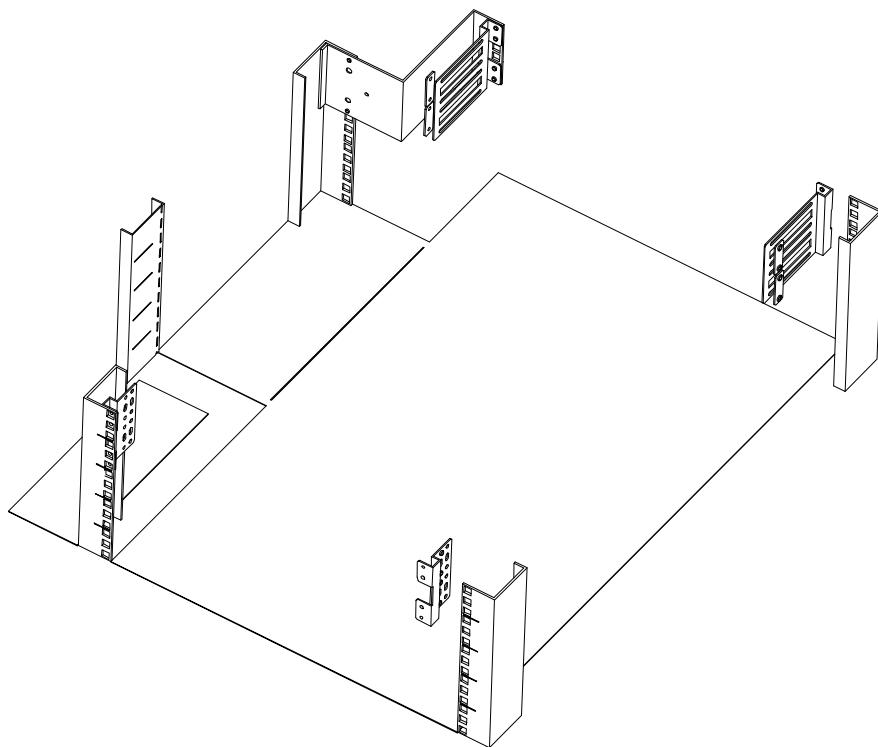

The adapter kit S26361-F2734-L14 is used for mounting older support systems which are exclusively designed for the Knürr attachment grid. At the same time it allows devices to be mounted in the PRIMECENTER and third-party racks, as it exclusively uses the square 19" grid for mounting.

10.2.2 Mounting examples

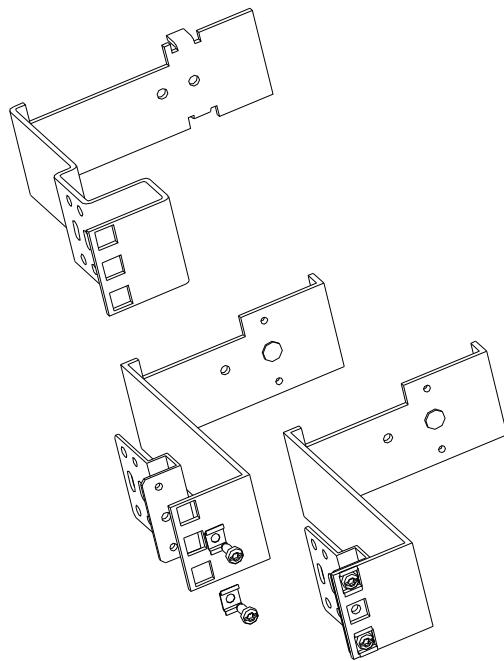

Example 3 shows the reconstruction of the Knürr side brackets for mounting older carrier systems

 Handling and Transportation Instructions
Notes on transportation, storing, and safety instructions overleaf

10.3.3 Notes on transport

Detaching from the wooden pallet

- The unit is seated on the pallet and is secured with 6 metal clamps, which must be unscrewed from the pallet.
- To remove the screws you need a Phillips screwdriver.
- Once the packaging foil has been removed, the unit must be slid off the pallet as shown above.

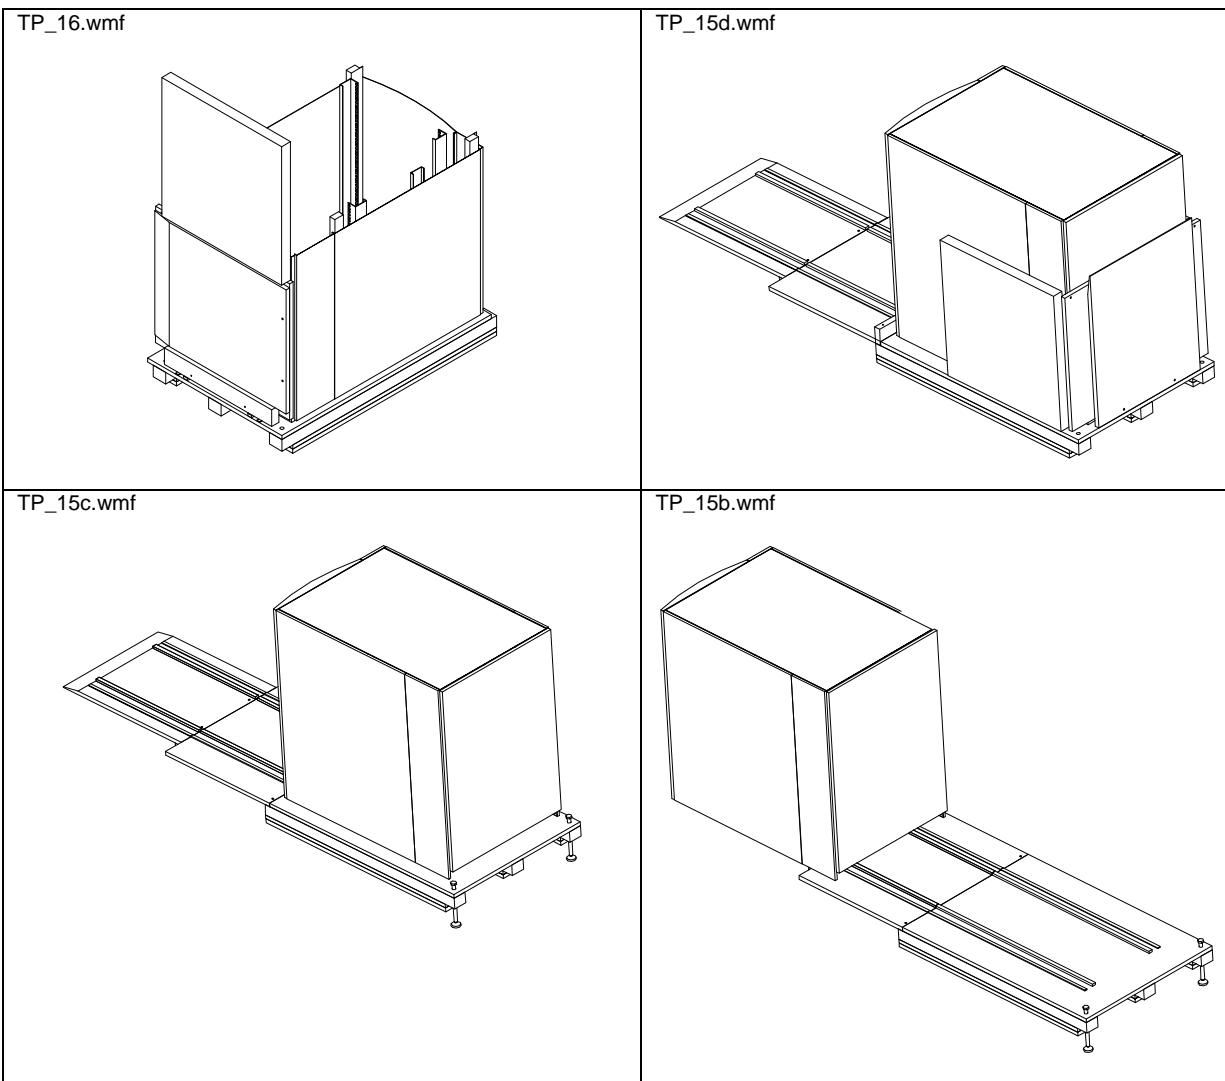

Transportation and storage

- The following mechanical and climatic environmental conditions according to EN 60721-3-1 and -3-2 must be observed:
 - **Storage:** Product class 1M3 / 1K2 1S2
 - **Transport:** Product class 2M2 / 2K2 2S1
- Attention: When transporting the unit, make sure it does not tilt more than 30°.
- The unit must remain in its original packaging until it reaches the installation location.

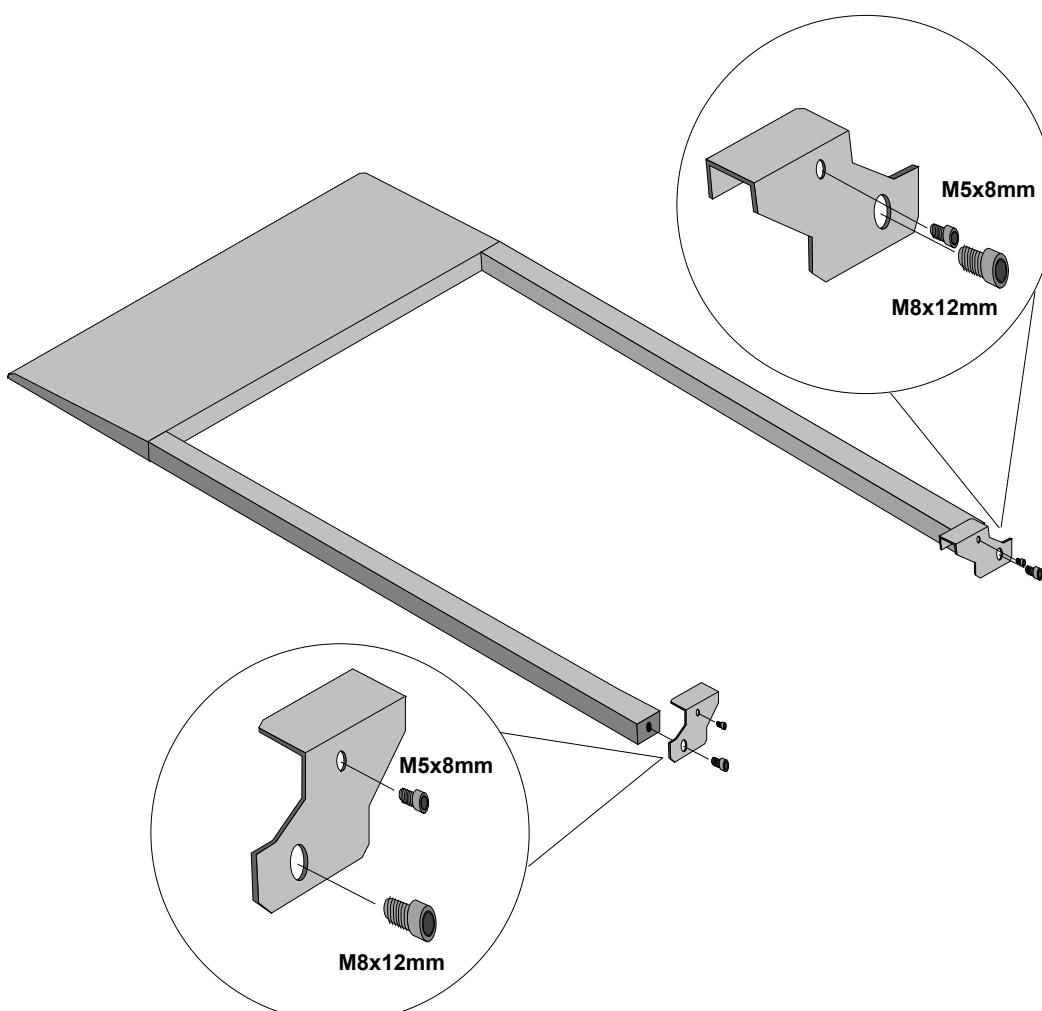

Safety instructions

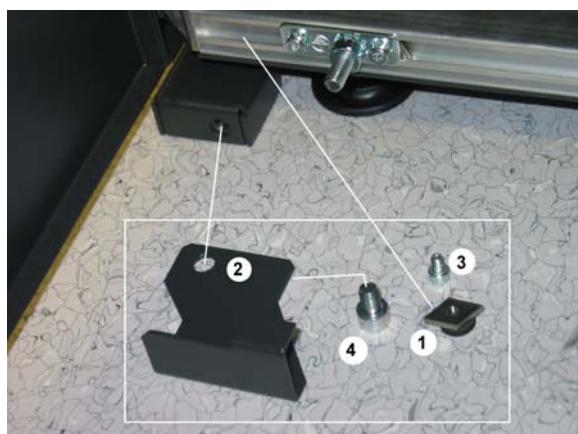

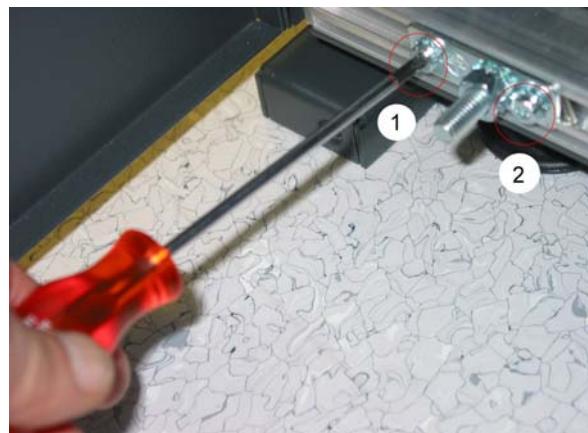

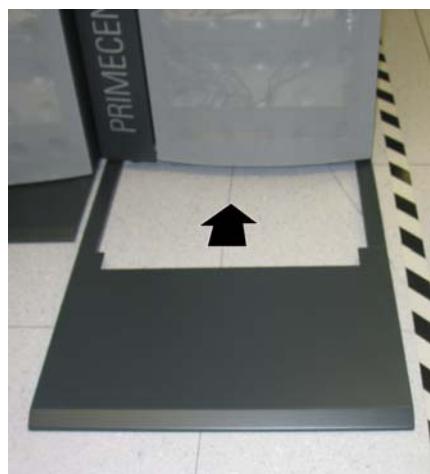

Before components are pulled out or started up, the anti-tilt plate must be installed.

For further important notes on the rack see the Technical Manual “Rack System”, chapter 2. You will find the manual in the accessory pack inside the rack.
